

A chemical reaction is a transformation of a chemical reaction in which the number of atoms of each element is conserved.

A coefficient represents the number of atoms of a particular element in a chemical reaction. A coefficient is placed directly in front of a chemical formula.

A subscript is placed after the element symbol to indicate the number of atoms of that element in a chemical formula.

Why is it important to balance chemical equations?

Chemical reactions are balanced to show that the number of atoms of each element is the same on both sides of the equation.

What does the total mass of a substance change when a chemical reaction occurs?

The total mass of a substance is conserved in a chemical reaction because matter is neither created nor destroyed.

Week 4, Day 2

The number of protons in an atom cannot change (it is fixed) but a different number of neutrons can change.

The most stable atomic configuration has a nucleus with a balanced number of protons and neutrons (the number of protons is equal to the number of neutrons).

How does a positive ion form from a neutral atom? What is another name for a positive ion?

When an atom loses one or more electrons, it has more protons than it does electrons, so it is no longer neutral. This atom has a positive charge and is called a positive ion or cation.

How does a negative ion form from a neutral atom? What is another name for a negative ion?

When an atom gains one or more electrons, it has more electrons than it does protons, so it is no longer neutral. This atom has a negative charge and is called a negative ion or anion.

Atoms in Group 1A have 1 electron in their outer shell and Group 2A atoms have 2 electrons in their outer shell. To become more stable (like the noble gases), the outermost electrons are easily given up (they become electrons). Group 1A atoms have 1 electron in their outer shell and easily lose it. Group 2A atoms have 2 electrons in their outer shell and easily lose them.

Atoms are formed by taking the first part of the element name and adding the suffix -ide. For example, sodium chloride, NaCl, is called a sodium chloride.

When positive and negative ions meet, the positive ions give up the electrons, becoming a neutral positively charged ion, and the negative ions become a neutral negatively charged ion.

The positively charged cation and the negatively charged anion are attracted to each other. The total bond length between the positively charged ion and the negatively charged ion is called the bond length.
