Objective Coefficient Sensitivity Report:

Strategic allocation of resources using linear programming model with parametric analysis: in MATLAB and Excel Solver
Dinesh Gupta, 2014-05-01 Since the late 1940s linear programming models have been used for many different purposes. Airline companies apply these models to optimize their use of planes and staff. NASA has been using them for years to optimize their use of limited resources. Oil companies use them to optimize their refinery operations. Small and medium sized businesses use linear programming to solve a huge variety of problems often involving resource allocation. In my study a typical product mix problem in a manufacturing system producing two products each product consists of two sub assemblies is solved for its optimal solution through the use of the latest versions of MATLAB having the command `simlp` which is very much like `linprog`. As analysts we try to find a good enough solution for the decision maker to make a final decision. Our attempt is to give the mathematical description of the product mix optimization problem and bring the problem into a form ready to call MATLAB's `simlp` command. The objective of this study is to find the best product mix that maximizes profit. The graph obtained using MATLAB commands give the shaded area enclosed by the constraints called the feasible region which is the set of points satisfying all the constraints. To find the optimal solution we look at the lines of equal profit to find the corner of the feasible region which yield the highest profit. This corner can be found out at the farthest line of equal profit which still touches the feasible region. The most critical part is the sensitivity analysis using Excel Solver and Parametric Analysis using computer software which allows us to study the effect on optimal solution due to discrete and continuous change in parameters of the LP model including to identify bottlenecks. We have examined other options like product outsourcing, one time cost, cross training of one operator, manufacturing of hypothetical third product on under utilized machines and optimal sequencing of jobs on machines.

Management Science Hans Daellenbach, Donald McNickle, Shane Dye, 2017-09-16. Management Science provides a comprehensive accessible overview of the subject incorporating a broad set of approaches and tools. The authors explore both soft and hard methodologies and highlight conceptual aspects rather than the mathematics of the techniques or computer methods. The book is therefore suitable for students and readers with a wide range of mathematical abilities at both the undergraduate and MBA level. The book bases management science within a clear systems thinking framework. Ideas and concepts are demonstrated with real life examples and case studies. Readers are shown how decision making over time under uncertainty and subject to constraints, multiple objectives and value and perception conflicts can be modelled all within this system thinking framework. The second edition of Management Science offers an emphasis on problem formulation indicating how management science and operational research techniques fit into the wider problem solving process. Revised chapters on queuing, simulation and problem structuring methods, updated coverage of forecasting, linear and integer programming. New sections on the role of management science consultants. Improved pedagogy, navigation and design. Up to date coverage of software. Real world case studies encouraging the reader to apply the concepts studied. Optimization Concepts and Applications in Engineering Ashok D. Belegundu, Tirupathi R. Chandrupatla, 2019-06-06. Organizations and businesses strive toward excellence and solutions to problems are based mostly on judgment and experience. However, increased competition and consumer demands require that the solutions be optimum and not just feasible. Theory leads to algorithms. Algorithms need to be translated into computer codes. Engineering problems need to be modeled. Optimum solutions are obtained using theory and computers and then interpreted. Revised and expanded in its third edition, this textbook integrates theory, modeling, development of numerical methods and problem solving, thus preparing students to apply optimization to real world problems. This text covers a broad variety of optimization problems using unconstrained, constrained, gradient and non-gradient techniques, duality concepts, multi-objective optimization, linear, integer, geometric and dynamic programming with applications and finite element based optimization. It is ideal for advanced undergraduate or graduate courses in optimization.
