Resource Allocation in Multiuser Multicarrier Wireless Systems Ian C. Wong, Brian Evans, 2007-11-15 Many algorithms have already been proposed in the past to solve the problem of allocating resources in a multi user multicarrier wireless system Due to the difficulty of the problem most of the previous work in this area has focused

on developing suboptimal heuristics without performance guarantees Resource Allocation in Multiuser Multicarrier Wireless Systems proposes a unified algorithmic framework based on dual optimization techniques that have complexities that are linear in the number of subcarriers and users and that achieve negligible optimality gaps in standards based numerical simulations Adaptive algorithms based on stochastic approximation techniques are also proposed which are shown to achieve similar performance with even much lower complexity

wireless communications **Orthogonal Frequency-division Multiplexing for Optical Communications** Daniel Jose Fernandes Barros, 2011 The drive towards higher spectral efficiency and maximum power efficiency in optical systems has generated renewed interest in the optimization of optical transceivers In this work we study the different optical applications Wide Area Networks WANs Metropolitan Area Networks MANs Local Area Networks LANs and Personal Area Networks PANs In WANs or long haul systems orthogonal frequency division multiplexing OFDM can compensate for linear distortions such as group velocity dispersion GVD and polarization mode dispersion PMD provided the cyclic prefix is sufficiently long Typically GVD is dominant as it requires a longer cyclic prefix Assuming coherent detection we show how to analytically compute the minimum number of subcarriers and cyclic prefix length required to achieve a specified power penalty trading off power penalties from the cyclic prefix and from residual inter symbol interference ISI and inter carrier interference ICI We derive an analytical expression for the power penalty from residual ISI and ICI We also show that when nonlinear effects are present in the fiber single carrier with digital equalization outperforms OFDM for various dispersion maps We also study the impairments of electrical to optical conversion when using Mach Zehnder MZ modulators OFDM has a high peak to average ratio PAR which can result in low optical power efficiency when modulated through a Mach Zehnder MZ modulator In addition the nonlinear characteristic of the MZ can cause significant distortion on the OFDM signal leading to in band intermodulation products between subcarriers We show that a quadrature MZ with digital pre distortion and hard clipping is able to overcome the previous impairments We consider quantization noise and compute the minimum number of bits required in the digital to analog converter D A Finally we discuss a dual drive MZ as a simpler alternative for the OFDM modulator but our results show that it requires a higher oversampling ratio to achieve the same performance as the quadrature MZ In MANs we discuss the use OFDM for combating GVD effects in amplified direct detection DD systems using single mode fiber We review known direct detection OFDM techniques including asymmetrically clipped optical OFDM ACO OFDM DC clipped OFDM DC OFDM and single sideband OFDM SSB OFDM and derive a linearized channel model for each technique We present an iterative procedure to achieve optimum power allocation for each OFDM technique since there is no closed form solution for amplified DD systems For each technique we minimize the optical power required to transmit at a given bit rate and normalized GVD by iteratively adjusting the bias and optimizing the power allocation among the subcarriers We verify that SSB OFDM has the best optical power efficiency among the different OFDM techniques We compare these OFDM techniques to on off keying OOK with maximum likelihood sequence detection MLSD and show that SSB OFDM can achieve the same optical power efficiency as OOK with MLSD but at the cost of requiring twice the electrical bandwidth and also a complex quadrature modulator We compare the computational complexity of the different techniques and show that SSB OFDM requires fewer operations per bit than OOK with MLSD In LANs we compare the performance of several OFDM schemes to that of OOK in combating modal dispersion in multimode fiber links We review known OFDM

techniques using intensity modulation with direct detection IM/DD including DC OFDM, ACO OFDM and pulse amplitude modulated discrete multitone PAM-DMT. We describe an iterative procedure to achieve optimal power allocation for DC OFDM and compare analytically the performance of ACO OFDM and PAM-DMT. We also consider unipolar M-ary pulse amplitude modulation M-PAM with minimum mean square error decision feedback equalization MMSE-DFE. For each technique we quantify the optical power required to transmit at a given bit rate in a variety of multimode fibers. For a given symbol rate we find that unipolar M-PAM with MMSE-DFE has a better power performance than all OFDM formats. Furthermore we observe that the difference in performance between M-PAM and OFDM increases as the spectral efficiency increases. We also find that at a spectral efficiency of 1 bit/symbol, OOK performs better than ACO OFDM using a symbol rate twice that of OOK. At higher spectral efficiencies M-PAM performs only slightly better than ACO OFDM using twice the symbol rate but requires less electrical bandwidth and can employ analog-to-digital converters at a speed only 81% of that required for ACO OFDM. In PANs we evaluate the performance of the three IM/DD OFDM schemes in combating multipath distortion in indoor optical wireless links comparing them to unipolar M-PAM with MMSE-DFE. For each modulation method we quantify the received electrical SNR required at a given bit rate on a given channel considering an ensemble of 170 indoor wireless channels. When using the same symbol rate for all modulation methods M-PAM with MMSE-DFE has better performance than any OFDM format over a range of spectral efficiencies with the advantage of M-PAM increasing at high spectral efficiency. ACO OFDM and PAM-DMT have practically identical performance at any spectral efficiency. They are the best OFDM formats at low spectral efficiency whereas DC OFDM is best at high spectral efficiency. When ACO OFDM or PAM-DMT are allowed to use twice the symbol rate of M-PAM these OFDM formats have better performance than M-PAM. When channel state information is unavailable at the transmitter however M-PAM significantly outperforms all OFDM formats. When using the same symbol rate for all modulation methods M-PAM requires approximately three times more computational complexity per processor than all OFDM formats and 63% faster analog-to-digital converters assuming oversampling ratios of 1.23 and 2 for ACO OFDM and M-PAM respectively. When OFDM uses twice the symbol rate of M-PAM OFDM requires 23% faster analog-to-digital converters than M-PAM but OFDM requires approximately 40% less computational complexity than M-PAM per processor.
