Figures 1 and 2 show the observed and predicted values of the probability of a firm's survival, based on the actual number of patents and the number of employees, respectively. The observed values are plotted against the predicted values, and the diagonal line represents the line of perfect agreement. The observed values are generally higher than the predicted values, indicating that the model tends to predict a lower probability of survival than what actually occurs.

- When a producer's price for a product is so low that it is sold at a loss, the government should subsidize the producer. Just as, protected by "tariffing" domestic consumers, a foreign producer is protected by a tariff, a domestic producer is protected by a subsidy. The government should subsidize a producer if the producer's price is so low that it is sold at a loss.
