Deep-ocean climate change impacts on habitat, fish and fisheries Food and Agriculture Organization of the United Nations,2019-03-22 This publication presents the outcome of a meeting between the FAO UNEP ABNJ Deep seas and Biodiversity project and the Deep Ocean Stewardship Initiative It focuses on the impacts of climatic changes on demersal fisheries and the interactions of these fisheries with other species and vulnerable marine ecosystems Regional fisheries management organizations rely on scientific information to develop advice to managers In recent decades climate change has been a focus largely as a unidirectional forcing over decadal timescales However changes can occur abruptly when critical thresholds are crossed Moreover distribution changes are expected as populations shift from existing to new areas Hence there is a need for new monitoring programmes to help scientists understand how these changes affect productivity and biodiversity The principal cause of climate change is rising greenhouse gases and other compounds in the atmosphere that trap heat causing global warming leading to deoxygenation and acidification in the oceans Three dimensional fully coupled earth system models are used to predict the extent of these changes in the deep oceans at 200 2500 m depth Trends in changes are identified in many variables including temperature pH oxygen and supply of particulate organic carbon POC Regional differences are identified indicating the complexity of the predictions The response of various fish and invertebrate species to these changes in the physical environment are analysed using hazard and suitability modelling Predictions are made to changes in distributions of commercial species though in practice the processes governing population abundance are poorly understood in the deep sea environment and predicted distributional changes are not always as expected and may be manifested as simple disappearance of species or ecosystems The publication underscores the fact adaptive monitoring and management mechanisms must be in place to ensure that fisheries are sustainable and the environment remains healthy and productive Suggestions are provided as to the actions necessary

The United States of Excess Robert Paarlberg,2015-03-02 Is it possible that America is hard wired to consume too much food and fuel Unfortunately yes says Robert Paarlberg in The United States of Excess America s excess is driven in each case by its distinct endowment of material and demographic resources its unusually weak national political institutions and a unique political culture that celebrates both individual freedoms over social responsibility and free markets over governmental authority America s over consumption is shown to be over determined Geology's Significant Sites and their Contributions to Geoheritage R. M. Clary,E.J. Pyle,W.M. Andrews,2024-07-23 The contributions in this book explore several geologically significant sites and in doing so acknowledge and explore not just the geological exposures themselves but also the people and issues that are fundamentally intertwined with the history of our science and its impact on our society Through selective examples of outcrops and locales integral to the history of geology we explore the evolution of modern geology as well as the geodiversity and geoheritage of our planet While the volume is far from comprehensive the chapters contained herein detail a range for geoheritage value scale of geoheritage sites and potential for geoheritage opportunities that will promote a broader richer understanding of the complexity of the geoheritage of Earth Importantly many chapters offer a cautionary tale of sites almost

Forest Hydrology Devendra Amatya, Thomas Williams, Leon Bren, Carmen de Jong, 2016-09-14 Forests cover approximately 26% of the world's land surface area and represent a distinct biotic community. They interact with water and soil in a variety of ways providing canopy surfaces which trap precipitation and allow evaporation back into the atmosphere thus regulating how much water reaches the forest floor as through fall as well as pull water from the soil for transpiration. The discipline forest hydrology has been developed throughout the 20th century. During that time human intervention in natural landscapes has increased and land use and management practices have intensified. The book will be useful for graduate students, professionals, land managers, practitioners and researchers with a good understanding of the basic principles of hydrology and hydrologic processes.

Empires of Sustainability Joseph Murphy, 2024-06-07 Focussing on the greening of imperialisms and empires, *Empires of Sustainability* analyses the shift around the world from denial of the environmental crisis to action to prevent catastrophe and the resulting implications. Evidence of this shift is clear in widespread and purposeful social change which is gathering momentum. The book explains how globalisation accelerated us towards the crisis and today even as its own legitimacy is being questioned, is evolving through solutions and responses to it. Looking ahead and as the environmental crisis worsens, two possible futures are discerned and explored. One is that through universal actions to save the planet, shaped by interweaving political and economic forces, the hegemony of globalisation is restored albeit in a green form. The other is that the world reorganises into competing spheres of influence with politics, economics and the environment interwoven differently in each case. In these ways we face the prospect of one or more *Empires of Sustainability* emerging over the decades ahead unless we build a better alternative society. The author presents an alternative, a more diverse World of Caring Places. This accessible book will appeal to students and scholars of international political economy, sustainability and environmental studies and analysts, policy makers, campaigners and others concerned about the future of relations between people and planet.
