Mathematical and Statistical Modeling for Emerging and Re-emerging Infectious Diseases Gerardo Chowell, James M. Hyman, 2016-07-27 The contributions by epidemic modeling experts describe how mathematical models and statistical forecasting are created to capture the most important aspects of an emerging epidemic Readers will discover a broad range of approaches to address questions such as Can we control Ebola via ring vaccination strategies How quickly should we detect Ebola cases to ensure epidemic control What is the likelihood that an Ebola epidemic in West Africa leads to secondary outbreaks in other parts of the world When does it matter to incorporate the role of disease induced mortality on epidemic models What is the role of behavior changes on Ebola dynamics How can we better understand the control of cholera or Ebola using optimal control theory How should a population be structured in order to mimic the transmission dynamics of diseases such as chlamydia Ebola or cholera How can we objectively determine the end of an epidemic How can we use metapopulation models to understand the role of movement restrictions and migration patterns on the spread of infectious diseases How can we capture the impact of household transmission using compartmental epidemic models How could behavior dependent vaccination affect the dynamical outcomes of epidemic models The derivation and analysis of the mathematical models addressing these questions provides a wide ranging overview of the new approaches being created to better forecast and mitigate emerging epidemics This book will be of interest to researchers in the field of mathematical epidemiology as well as public health workers

Models and Estimation of Genetic Effects José M Álvarez-Castro, Rong-Cai Yang, 2015-04-17 Ronald Fisher needed to develop elaborate models of genetic effects in order to set the foundations of Quantitative Genetics in his 1918 paper The correlation between relatives on the supposition of Mendelian inheritance Since then many significant implementations have been made to model genetic effects However at the verge of one century after Fisher's kick off models of genetic effects keep on being discussed and implemented Indeed the relatively recent advent of QTL analyses challenged the state of the art of this field by providing researchers the opportunity to obtain and analyze estimates of genetic effects from real data In this context the development of this field was not exempt of some

poleemics like the debate about the convenience of the functional and the statistical epistasis approaches This research topic is meant to provide recent developments in models and estimation of genetic effects and to enrich the discussion about how and why models of genetic effects must be further developed and applied The articles in this Research Topic shall thus extend refine and or provide a refresh look at Fisher s original models of genetic effects and their application to genetic effects estimation and to improve our understanding of evolutionary processes and breeding programs Informatics, Networking and Intelligent Computing Jiaxing Zhang,2015-05-06 This proceedings volume contains selected papers presented at the 2014 International Conference on Informatics Networking and Intelligent Computing held in Shenzhen China Contributions cover the latest developments and advances in the field of Informatics Networking and Intelligent Computing

Neural Masses and Fields: Modelling the Dynamics of Brain Activity Karl Friston, 2015-05-25

Biophysical modelling of brain activity has a long and illustrious history and has recently profited from technological advances that furnish neuroimaging data at an unprecedented spatiotemporal resolution

Neuronal modelling is a very active area of research with applications ranging from the characterization of neurobiological and cognitive processes to constructing artificial brains in silico and building brain machine interface and neuroprosthetic devices

Biophysical modelling has always benefited from interdisciplinary interactions between different and seemingly distant fields ranging from mathematics and engineering to linguistics and psychology

This Research Topic aims to promote such interactions by promoting papers that contribute to a deeper understanding of neural activity as measured by fMRI or electrophysiology

In general mean field models of neural activity can be divided into two classes neural mass and neural field models

The main difference between these classes is that field models prescribe how a quantity characterizing neural activity such as average depolarization of a neural population evolves over both space and time as opposed to mass models which characterize activity over time only by assuming that all neurons in a population are located at approximately the same point

This Research Topic focuses on both classes of models and considers several aspects and their relative merits that span from synapses to the whole brain comparisons of their predictions with EEG and MEG spectra of spontaneous brain activity evoked responses seizures and fitting data to infer brain states and map physiological parameters

Complex Problem Solving Beyond the Psychometric Approach Wolfgang Schoppek, Joachim Funke, Magda Osman, Annette Kluge, 2018-09-28

Complex problem solving CPS and related topics such as dynamic decision making DDM and complex dynamic control CDC represent multifaceted psychological phenomena

In abroad sense CPS encompasses learning decision making and acting in complex and dynamic situations

Moreover solutions to problems that people face in such situations are often generated in teams or groups

This adds another layer of complexity to the situation itself because of the emerging issues that arise from the social dynamics of group interactions

This framing of CPS means that it is not a single construct that can be measured by using a particular type of CPS task e g minimal complex system tests which is a view taken by the psychometric community

The proposed approach taken here is that because CPS is multifaceted multiple approaches need to be taken to fully capture and understand what it is and how the different cognitive processes associated with it complement each other

Thus this Research Topic is aimed at showcasing the latest work in the fields of CPS as well as DDM and CDC that takes a holist approach to investigating and theorizing about these abilities

The collection of articles

encompasses conceptual approaches as well as experimental and correlational studies involving established or new tools to examine CPS DDM and CDC This work contributes to answering questions about what strategies and what general knowledge can be transferred from one type of complex and dynamic situation to another what learning conditions result in transferable knowledge and skills and how these features can be trained

Engineering Emergence Larry B. Rainey, Mo Jamshidi, 2018-09-03 This book examines the nature of emergence in context of man made i e engineered systems in general and system of systems engineering applications specifically It investigates emergence to interrogate or explore the domain space from a modeling and simulation perspective to facilitate understanding detection classification prediction control and visualization of the phenomenon Written by leading international experts the text is the first to address emergence from an engineering perspective System engineering has a long and proud tradition of establishing the integrative view of systems The field however has not always embraced and assimilated well the lessons and implications from research on complex adaptive systems As the editors note there have been no texts on Engineering Emergence Principles and Applications It is therefore especially useful to have this new edited book that pulls together so many of the key elements ranging from the theoretical to the practical and tapping into advances in methods tools and ways to study system complexity Drs Rainey and Jamshidi are to be congratulated both for their vision of the book and their success in recruiting contributors with so much to say Most notable however is that this is a book with engineering at its core It uses modeling and simulation as the language in which to express principles and insights in ways that include tight thinking and rigor despite dealing with notably untidy and often surprising phenomena Paul K Davis RAND and Frederick S Pardee RAND Graduate School The first chapter is an introduction and overview to the text The book provides 12 chapters that have a theoretical foundation for this subject Includes 7 specific example chapters of how various modeling and simulation paradigms techniques can be used to investigate emergence in an engineering context to facilitate understanding detection classification prediction control and visualization of emergent behavior The final chapter offers lessons learned and the proposed way ahead for this discipline

Reviews ,1974 **Mathematical and Control Applications in Agriculture and Horticulture** W. Day,Yasushi Hashimoto,2014-07-04 This title provides a general overview of recent developments and research into types of systems and their uses in the agricultural and horticultural industry 64 papers are included containing both theoretical models and applied examples for greenhouse systems harvesting technology and plant factory systems *The Economics of Oil* S.W. Carmalt,2016-12-26 This book examines the ways that oil economics will impact the rapidly changing global economy and the oil industry itself over the coming decades The predictions of peak oil were both right and wrong Oil production has been constrained in relation to demand for the past decade with a resulting four fold increase in the oil price slowing the entire global economy High oil prices have encouraged a small increase in oil production and mostly from the short lived fracking revolution but enough to be able to claim that peak oil was a false prophecy The high oil price has also engendered massive exploration investments but remaining hydrocarbon stocks generally offer poor returns in energy the energy return on

investment or EROI and financial terms and no longer replace the reserves being produced As a result the economically powerful oil companies are under great pressure both financially and politically as oil remains the backbone of the global economy Development scenarios and political pressure for growth as a means of solving economic woes both require more net energy which is the amount of energy available after energy and thus financial inputs required for new sources to come on line are deducted In today's economy more energy usually means more oil Although a barrel of oil from any source may look the same tight oil and oil from tar sands require much higher prices to be profitable for the producer these expensive sources have very different economic implications from the conventional oil supplies that underpinned economic growth for most of the 20th century The role of oil in the global economy is not easily changed Since currently installed infrastructure assumes oil a change implies more than just substitution of an energy source The speed with which such basic structural changes can be made is also constrained and ultimately themselves dependent on fossil fuel inputs It remains unclear how this scenario will evolve and that uncertainty adds additional economic pressure to the investment decisions that must be made Drill baby drill and new pipeline projects may be attractive politically but projections of economic and associated oil production growth based on past performance are clearly untenable
