Insect Microbiome: From Diversity To Applications George Tsiamis, Brian Weiss, Adly M. M. Abdalla, 2023-03-21 Insects are by far the most diverse and abundant animal group with respect to the number of species globally in ecological habitats and in biomass The ecological and evolutionary success of insects depends in part on their countless relationships with beneficial microorganisms which are known to influence all aspects of their physiology ecology and evolution These symbiotic associations are known to a enhance nutrient poor diets b aid digestion of recalcitrant food components c protect from predators parasites and pathogens d contribute to inter and intraspecific communication e affect efficiency as disease vectors and f govern mating and reproductive systems Characterization exploitation and management of the insect bacterial symbiotic associations can contribute significantly to the control of agricultural pests and disease vectors Insects that depend exclusively on nutritionally restricted diets such as plant sap vertebrate blood and woody material commonly possess obligate mutualistic endosymbionts involved in the provision of essential nutrients or in the degradation of food materials These intracellular mutualists commonly have the following biological features a they localize inside bacteriocytes b are essential for fitness c are maternally transmitted and d display strict host symbiont co evolutionary patterns In addition to obligate endosymbionts many insects harbor bacteria that are not essential for their survival or fecundity and are typically maintained with a patchy distribution in host populations Such symbionts can induce reproductive phenotypes in insect hosts including male killing feminization parthenogenesis or cytoplasmic incompatibility Because these bacteria manipulate their host s reproductive biology they also likely accelerate host processes As for essentially all animals

microbial communities are particularly prominent in the digestive tract where they may be key mediators of the varied lifestyles of insect hosts The contribution of microorganisms particularly gut microorganisms to insect function is highly relevant from several perspectives linking to applications in medicine agriculture and ecology Gut associated microorganisms can include protists fungi archaea and bacteria but it is generally accepted that bacterial species dominate the microbial community in the guts of most insects Gut associated bacteria can influence a vectoring efficiency b developmental time c decomposition of plant biomass and carbon cycle d nitrogen fixation and nitrogen cycle e mating incompatibilities and f detoxification of pesticides leading to the acquisition of insecticide resistance **Journal of the National Cancer**

,2005 *Bacterial Exotoxins: How Bacteria Fight the Immune System* Inka Sastalla,Denise M. Monack,Katharina F. Kubatzky,2016-10-07 Bacterial pathogenicity factors are functionally diverse They may facilitate the adhesion and colonization of bacteria influence the host immune response assist spreading of the bacterium by e g evading recognition by immune cells or allow bacteria to dwell within protected niches inside the eukaryotic cell Exotoxins can be single polypeptides or heteromeric protein complexes that act on different parts of the cells At the cell surface they may insert into the membrane to cause damage bind to receptors to initiate their uptake or facilitate the interaction with other cell types For example bacterial superantigens specifically bind to major histocompatibility complex MHC II molecules on the surface of antigen presenting cells and the T cell receptor while cytolysins cause pore formation For intracellular activity exotoxins need to be translocated across the eukaryotic membrane Gram negative bacteria can directly inject effector proteins in a receptor independent manner by use of specialized needle apparatus such as bacterial type II III or type IV secretion systems Other methods of translocation include the phagocytic uptake of bacteria followed by toxin secretion or receptor mediated endocytosis which allows the targeting of distinct cell types Receptor based uptake is initiated by the binding of heteromeric toxin complexes to the cell surface and completed by the translocation of the effector proteins across the endosomal membrane In the cytosol toxins interact with specific eukaryotic target proteins to cause post translational modifications that often result in the manipulation of cellular signalling cascades and inflammatory responses It has become evident that the actions of some bacterial toxins may exceed their originally assumed cytotoxic function For example pore forming toxins do not only cause cytolysis but may also induce autophagy pyroptosis or activation of the MAPK pathways resulting in adjustment of the host immune response to infection and modification of inflammatory responses both locally and systemically Other recently elucidated examples of the immunomodulatory function of cell death inducing exotoxins include TcdB of Clostridium difficile which activates the inflammasome through modification of cellular Rho GTPases or the Staphylococcus aureus toxin which activates mast cells The goal of this research topic was to gather current knowledge on the interaction of bacterial exotoxins and effector proteins with the host immune system The following 16 research and review

articles in this special issue describe mechanisms of immune modification and evasion and provide an overview over the complexity of bacterial toxin interaction with different cells of the immune system     Physiology, Biochemistry, and Pharmacology of Transporters for Organic Cations Giuliano Ciarimboli, 2021-06-24 Membrane transporters are of vital importance for cells. They mediate the flux of many substances through the plasma membrane. In this book, the transporters for organic cations, a special class of membrane transporters, are presented. Transporters belonging to this class are important because they allow many neurotransmitters (e.g., histamine and serotonin) and many drugs (e.g., trospium and tofacitinib) to permeate the plasma membrane. Therefore, transporters for organic cations can modulate the action of neurotransmitters and drugs, having in this way important physiological and pharmacological implications. These aspects are illustrated in original works and reviews presented in this book. Using a system biology approach, the global significance of different transporters working together has been illustrated. Regulation mechanisms determining their expression in specific organs and modulating their function are also described in this book, also concerning their role for special drug toxicities. Such an aspect is also discussed in relationship to mutations, single nucleotide polymorphisms of transporters for organic cations. Finally, the translational value of studies performed in flies, mice, and rats is discussed. Therefore, this book offers integrative information on transporters for organic cations, which may be of interest to beginners and specialized scientists in this field.     Novel Anticancer Drug Protocols John K. Buolamwini, Alex A. Adjei, 2008-02-01 We are in an exciting era in the war against cancer, with real prospects for novel anticancer drugs that are cancer cell specific without the toxicities that have been the hallmark of conventional cytotoxic cancer chemotherapy. Advances in cancer cell biology, fueled by the molecular biology revolution, have resulted in the uncovering of many novel potential molecular targets for cancer therapy. New anticancer drug discovery and development is now largely focused on exploiting these new molecular targets, which encompass oncogenes, tumor suppressor genes, and their gene products, as well as targets involved in tumor angiogenesis, metastasis, survival, and longevity mechanisms. Exploitation of some of these targets has already yielded fruits and introduced new paradigms of molecularly targeted cancer therapy into the clinic, namely, protein kinase inhibition by antibodies or small molecules exemplified by Herceptin (trastuzumab), a humanized antibody targeted against the HER2 growth factor receptor tyrosine kinase for the treatment of metastatic breast cancer, and Gleevec (imatinib), a small molecule bcr-abl kinase inhibitor for the treatment of chronic myelogenous leukemia.
