Function of the Nervous System

The nervous system has three specific functions:

1. Receives information from the environment and initiates responses.
2. Coordinates and controls the body's activities.
3. Regulates the body's internal environment.

The nervous system is divided into two main parts:

- Central Nervous System (CNS)
- Peripheral Nervous System (PNS)

The CNS consists of the brain and spinal cord.

The PNS consists of all the other nerves in the body.

The brain is the control center of the nervous system.

The spinal cord is the main communication pathway between the brain and the rest of the body.

The nerves are the wires that carry messages between the brain and the rest of the body.

The messages are carried by electrical impulses.

The impulses travel along the axons of the neurons.

The neurons are the basic units of the nervous system.

The neurons are made up of a cell body and axons.

The cell body contains the nucleus and organelles.

The axons are long projections that carry the impulses.

The axons are covered by a myelin sheath.

The myelin sheath is made of glial cells.

The glial cells are support cells that help the neurons function.

The glial cells also provide nutrients to the neurons.

The glial cells also remove waste from the nervous system.

The glial cells also form the blood-brain barrier.

The blood-brain barrier is a selective barrier that prevents toxins from entering the brain.

The blood-brain barrier is made of endothelial cells.

The endothelial cells are specialized cells that line the blood vessels in the brain.

The endothelial cells have tight junctions that prevent toxins from passing through.

The tight junctions are made of proteins.

The proteins are anchored to the cell membranes of the endothelial cells.

The proteins are cross-linked to each other, forming a barrier.

The barrier prevents toxins from entering the brain.

The barrier also allows nutrients to enter the brain.

The barrier is dynamic, meaning it can change over time.

The barrier can become more permeable in response to injury or disease.

The barrier can also become less permeable in response to injury or disease.

The barrier is essential for the proper functioning of the nervous system.

The barrier is critical for the survival of the brain.

It is divided into two main branches:

- Sympathetic Nervous System** (fight or flight)
- Parasympathetic Nervous System** (rest and digest)

The Autonomic Nervous System is responsible for controlling the following functions:

- Heart rate
- Blood pressure
- Respiration
- Digestion
- Excretion
- Reproduction

The Autonomic Nervous System is controlled by the brain and spinal cord.

Brain and Spinal Cord

The brain and spinal cord are the central parts of the nervous system. They are responsible for processing information and sending out instructions to the rest of the body.

The brain is divided into three main parts:

- Cerebrum** (the largest part, responsible for thinking and reasoning)
- Cerebellum** (responsible for balance and coordination)
- Brainstem** (responsible for basic life functions like breathing and heart rate)

The spinal cord is a long, thin structure that runs down the back. It is responsible for carrying messages between the brain and the rest of the body.
