

Applications Using Trigonometry

Many problems in daily life can be solved by using trigonometry. Often such problems involve an angle of elevation or an angle of depression.

Example: The angle of elevation from point A to the top of a cliff is 30° . If point A is 40 feet from the base of the cliff, how high is the cliff?

Let x represent the height of the cliff.
Then $\tan 30^\circ = \frac{x}{40}$.

$$30 \tan 30^\circ = x$$

This is multiplication, not the sine angle, so do not use $\sin$.

$$\tan 30^\circ = \frac{x}{40} \quad 40 \tan 30^\circ = x \quad 40 \tan 30^\circ \approx 23.094$$

The cliff is about 23 feet high.

Solve each problem. Round answers to the nearest hundredth and measure all angles to the nearest degree.

- From the top of a tower, the angle of depression to a statue on the ground is 72° . The top of the tower is 40 feet above ground. How far is the statue from the base of the tower?
- A tree 40 feet high casts a shadow 60 feet long. Find the measure of the angle of elevation of the sun.
- A ladder leaning against a house reaches an angle of 60° with the ground. The foot of the ladder is 7 feet from the base of the house. How long is the ladder?
- A building on a 50-foot rising incline has an angle of 30° with the ground. How high above the ground is the bottom of the house of the person building the house in direct along the ground?
