4. I wanted to see if the composition of a baking sheet had an effect on the amount of time it took to bake cookies. I made the cookie dough using the same amount of ingredients and mixed both for the same amount of time. I used a "cookie scooper" to measure out the dough so that each cookie was the same size. Tray #1 was made from Aluminum and Tray #2 was made from Teflon. For tray # 1, I used the Whirlpool model 457 oven and baked the cookies at 350 °F. For tray #2 I used the Whirlpool model 457 oven and baked the cookies at 400 °F. I used the same timer for both trays to measure how long it took to finish.

**Explain where did I go wrong?** Use ALL of the following words:

independent variable, dependent variable, fair test, constant, control. (Write in complete sentences)

This experiment was not a FAIR TEST. The original INDEPENDENT VARIABLE was to see how a change in the amount of time would affect the DEPENDENT VARIABLE (Finishing time of baked cookies). This means the time in the oven should have been the only variable to change, but the experimenter also changed the type of tray, and the oven temperature. Both trays should have remained CONSTANT along with the size of the cookies, the oven used, the temperature, and ingredients.

A better test would have been to see how the oven temperature affected the finishing time of the cookies. The experimenter would have kept everything constant except the oven temperature and used the cookie recipe's suggested temperature as the CONTROL.

5. Match the uses for each of the following pieces of lab equipment to its name:

B. Holds and heats lab specimens; mixing done through swirling

C. Used to measure precise quantities of liquid
