

12. Weight Reduction in Gravity

Goal: Investigate how weight changes when the gravitational field strength and density of the object are changed. Understand the relationship between mass, weight, and density.

Materials: A spring scale, a string, a weight, a ruler.

Procedure: Attach the weight to the spring scale and measure its weight in air.

Weight in Air

The weight of an object is the force exerted on it by gravity. It is measured in newtons (N). The weight of an object can be calculated using the formula: $W = mg$, where W is weight, m is mass, and g is the acceleration due to gravity.

Goal: Calculate the weight of an object in air and in water.

Procedure: Attach the weight to the spring scale and measure its weight in air.

Results: The weight of the object in air is 10 N. The weight of the object in water is 5 N.

Conclusion: The weight of an object is less in water than in air.

Discussion: The weight of an object is less in water than in air because of the buoyant force exerted by the water.

Weight in Water

The weight of an object in water is the force exerted on it by gravity, minus the buoyant force exerted by the water.

Goal: Calculate the weight of an object in water and compare it to its weight in air.
