Paramei, Cees van Leeuwen, 2016-05-31 Starting from psychophysics over the last 50 years most progress in unravelling the mechanisms of color vision has been made through the study of single cell responses mainly in LGN and striate cortex A similar development in the study of form perception may seem to be underway centred on the study of temporal cortex However because of the combinatorial characteristics of form perception we are also observing the opposite tendency from single cell activity to population coding and from static receptive field structures to system dynamics and integration and ultimately a synthetic form of psychophysics of color and form perception From single cells to system integration it is this development the present Research Topic wishes to highlight and promote How does this development affect our views on the various attributes of perception In particular we are interested in to what extent evolving knowledge in the field of color perception is relevant within a developing integrative framework of form perception The goal of this Research Topic is to bring together experimental research encompassing both color and form perception For this volume we planned a broad scope of topics on color in complex scenes color and form as well as dynamic aspects of form perception We expect that the Research Topic will be attractive to the community of researchers whose work straddles the boundary between the two visual perception fields as well as to the wider community interested in integrative systems neuroscience
