Introduction to Hydrogeology J.C. Nonner, Johannes Nonner, 2002-01-01 Providing an introduction to the crucially important topic of groundwater this text covers all major fields of hydrogeology and includes outlines of the occurrence of groundwater in various rock types the movement and storage of groundwater the formulation of groundwater balances the development of groundwater chemistry as well as the practical application of hydrogeology for groundwater development Following a unique systems approach to describe and connect its various elements the text also explores a large selection of examples of groundwater cases from various parts of the world In addition theoretical sections and examples are illustrated with a number of drawings photos and computer printouts Suitable for education in hydrogeology at postgraduate and graduate level the text is also a useful reference tool for professionals and decision makers involved in water or water related activities In the revised paperback edition of Introduction to Hydrogeology February 2006 suggestions of reviewers students and colleagues have been taken into account This means that more attention is paid to the processes in the unsaturated zone especially those relating to groundwater recharge Also in the revised edition the investigation methods are highlighted in the sections where the related theory is dealt with and they are not presented in the last chapter on groundwater management Chapter titles are re named and some definitions are adjusted The References and Bibliography section is also extended some figures are improved and the inevitable typing errors are corrected as well

Groundwater Contamination: Use of Models in Decision-Making G. Jousma, Jacob Bear, Y.Y. Haimes, F. Walter, 2012-12-06 The protection of groundwater resources has emerged in recent years as a high priority topic on the agenda of many countries In responding to the growing concern over deteriorating groundwater quality many countries are developing a comprehensive regulatory framework for the management of subsurface water resources with management referring to both quantity and quality aspects Within this framework groundwater models are rapidly coming to play a central role in the development of protection and rehabilitation strategies These models provide forecasts of the future state of the groundwater aquifer systems and of the unsaturated zone in response to proposed management initiatives For example models will predict the effects of implementing a proposed management scheme on water levels and on the transport and fate of pollutants The models are now used in the formulation of policies and regulations the issuing of permits design of monitoring and data collection systems and the development of enforcement actions The growth in the use of these sophisticated tools has led to many unforeseen problems in groundwater management Lingering issues include

reliability of codes quality assurance in model development and applications efficient utilization of human and material resources technology transfer and training Some issues have legal ramifications as in cases where the applications of models have been contested in courts
