ABSTRACT

Power quality has now turned into the most important issue for equally transmitters and domestic users. People are doing efforts to enhance power quality. The custom power devices which are used for power quality enhancement are basically made from power electronic devices for example the state transfer switch (STS) and active filters. In this present work single – phase UPQC with minimum voltage angle injection control is used for 14 bus system and the result has been compared with and excluding power electronic custom power device. The required model is developed in Simulink/MATLAB and both types of loads has been applied either steady state or dynamic. The resistance and inductive loads has been inserted at the center of simulation model by turning on and off of circuit breaker, which is placed at bus 2. The output is compared in terms of real and reactive power. The system with UPQC has enhanced values of real power, voltage and current and also posse's only minimum harmonics when load is ON and OFF. However, arrangement without UPQC is not constant and has excess harmonics in current and voltage waveforms and also high values of Total Harmonic Distortion

Keywords: IEEE 14 bus system, total harmonic reduction (THD), active power, reactive power, UPQC etc..

I. INTRODUCTION

Electric power is the most important form of energy that is being used in daily life. Electricity is available almost everywhere; the need of hour is that the power quality must be up to the mark. A perfect power supply would be one that is every time available, always remains within voltage and frequency limits, should be noise free. Power quality can be stated as "deviations from normal voltage or current". Another way of defining power quality is that "loads ability to function properly". Without good power quality the load may overheat, malfunction, and require high maintenance. Power quality has direct impact on electrical consumption and electrical demand. Poor electrical power increases the amps required in electrical network and vice versa. The bad power quality has a demagnetizing impact on electrical and mechanical equipment's and it also has an impact on electricity bills. Also the main goal of power system function is to fulfill the demand at all the places inside power network reliably as possible. The electric power generation systems use the available natural resources for power generation e.g. coal, water, sunlight etc. The method of operation of these generation system is based on usefulness of centralized generators. The power coming out from these generation systems is distributed in particular areas by transmission and distribution systems. In these days the power coming out from central power plants is reduced due to conventional resources are getting extinguished day by day. And at the same time cost of power transmission is increased.

■ Custom power devices

Custom power devices are the electronics devices which are manufactured only for mitigation of the problems that are usually created by poor power qualities in customer and industries, so that their performance may not get affected. These devices are usually used in distribution system to sustain the constant voltage profile (power quality)

Customer power quality are classified into two types
