Methods and Concepts for Designing and Validating Smart Grid Systems Thomas I. Strasser, Sebastian Rohjans, Graeme M. Burt, 2019-11-20 Energy efficiency and low carbon technologies are key contributors to curtailing the emission of greenhouse gases that continue to cause global warming The efforts to reduce greenhouse gas emissions also strongly affect electrical power systems Renewable sources storage systems and flexible loads provide new system controls but power system operators and utilities have to deal with their fluctuating nature limited storage capabilities and typically higher infrastructure complexity with a growing number of heterogeneous components In

addition to the technological change of new components the liberalization of energy markets and new regulatory rules bring contextual change that necessitates the restructuring of the design and operation of future energy systems Sophisticated component design methods intelligent information and communication architectures automation and control concepts new and advanced markets as well as proper standards are necessary in order to manage the higher complexity of such intelligent power systems that form smart grids Due to the considerably higher complexity of such cyber physical energy systems constituting the power system automation protection information and communication technology ICT and system services it is expected that the design and validation of smart grid configurations will play a major role in future technology and system developments However an integrated approach for the design and evaluation of smart grid configurations incorporating these diverse constituent parts remains elusive The currently available validation approaches focus mainly on component oriented methods In order to guarantee a sustainable affordable and secure supply of electricity through the transition to a future smart grid with considerably higher complexity and innovation new design validation and testing methods appropriate for cyber physical systems are required Therefore this book summarizes recent research results and developments related to the design and validation of smart grid systems

Intelligent Integrated Energy Systems Peter Palensky, Miloš Cvetković, Tamás Keviczky, 2018-10-26 This book presents research results of PowerWeb TU Delft's consortium for interdisciplinary research on intelligent integrated energy systems and their role in markets and institutions In operation since 2012 it acts as a host and information platform for a growing number of projects ranging from single PhD student projects up to large integrated and international research programs The group acts in an inter faculty fashion and brings together experts from electrical engineering computer science mathematics mechanical engineering technology and policy management control engineering civil engineering architecture aerospace engineering and industrial design The interdisciplinary projects of PowerWeb are typically associated with either of three problem domains Grid Technology Intelligence and Society PowerWeb is not limited to electricity it bridges heat gas and other types of energy with markets industrial processes transport and the built environment serving as a singular entry point for industry to the University's knowledge Via its Industry Advisory Board a steady link to business owners manufacturers and energy system operators is provided
