

A chemical reaction is a transformation of a chemical substance in which the molecular formulae are written using chemical formulae instead of words.

Chemical reactions are written using chemical formulae instead of words.

A coefficient represents the number of atoms or molecules present in a chemical reaction. A coefficient is placed directly in front of a chemical formula or symbol.

A subscript is placed after the element symbol to indicate the number of atoms of that element in a molecule.

Why is it important to balance chemical equations?

Chemical reactions are balanced to show that the number of atoms of each element is the same on both sides of the equation. This is done by adding coefficients in front of the chemical formulae.

What does the total say is important to remember when balancing equations?

Remember, the total number of atoms of each element must be the same on both sides of the equation.

How does a positive ion form from a neutral atom? What is another name for a positive ion?

When an atom loses one or more electrons, it has more protons than it does electrons, so it is no longer neutral. This atom has a positive charge and is called a positive ion or cation.

How does a negative ion form from a neutral atom? What is another name for a negative ion?

When an atom gains one or more electrons, it has more electrons than it does protons, so it is no longer neutral. This atom has a negative charge and is called a negative ion or anion.

Atoms in Group 1A have 1 electron in their outer shell and Group 2A atoms have 2 electrons in their outer shell. To become more stable (like the noble gases) the outer shell must be full. They easily give up their outer electrons (losing 1 or 2 electrons) to form the most stable electron configuration of the noble gas next to them.

Atoms are formed by losing the first part of the element name and adding the suffix -ide. For example, sodium chloride, NaCl, is called a sodium chloride.
