Section Molecular Composition Of Gases:

The Composition of the Basaltic Gas Phase Bert E. Nordlie, 1971 Volcanic gas collections are used to calculate the composition of the original magmatic gas. Alteration from this original gas to varying degrees by surface or near surface modifying processes is hypothesized. Four methods of removing atmospheric contamination give for each sample four atomic compositions which yield equilibrium molecular compositions from 650 to 1250 C at 1 atm. The compositions are used to examine other modifying processes. It is shown that water contamination causes all variations in hydrogen content. Sulfur content changes considerably from loss of SO₂. Atmospheric and water contamination and SO₂ loss are shown to account for all modifications. Although all samples were derived from an equilibrium composition at magmatic temperatures, examination shows that none is at equilibrium composition as collected. Imperfect quenching during and oxidation during and after collection caused nonequilibrium. The various contaminations and losses are discussed as they affect the total gas composition, quantitative amounts of additions and losses being presented for each sample.

Molecular Structure by Diffraction Methods G. A. Sim, 1973 Specialist Periodical Reports provide systematic and detailed review coverage of progress in the major areas of chemical research. Written by experts in their specialist fields, the series creates a unique service for the active research chemist, supplying regular critical in-depth accounts of progress in particular areas of chemistry. For over 80 years the Royal Society of Chemistry and its predecessor the Chemical Society have been publishing reports charting developments in chemistry which originally took the form of Annual Reports. However, by 1967 the whole spectrum of chemistry could no longer be contained within one volume and the series Specialist Periodical Reports was born. The Annual Reports themselves still existed but were divided into two and subsequently three volumes covering Inorganic, Organic, and Physical Chemistry. For more general coverage of the highlights in chemistry, they remain a must. Since that time the SPR series has altered according to the fluctuating degree of activity in various fields of chemistry. Some titles have remained unchanged while others have altered their emphasis along with their titles; some have been combined under a new name, whereas others have had to be discontinued. The current list of Specialist Periodical Reports can be seen on the inside flap of this volume.

Applications of Molecular Simulation in the Oil and Gas Industry Philippe Ungerer, Bernard Tavittian, Anne Boutin, 2005 Molecular simulation is an emerging technology for determining the properties of many systems that are of interest to the oil and gas industry and more generally to the chemical industry Based on a universally accepted theoretical background molecular simulation accounts for the precise structure of molecules in evaluating their interactions Taking advantage of the

availability of powerful computers at moderate cost molecular simulation is now providing reliable predictions in many cases where classical methods such as equations of state or group contribution methods have limited prediction capabilities This is particularly useful for designing processes involving toxic components extreme pressure conditions or adsorption selectivity in microporous adsorbents Molecular simulation moreover provides a detailed understanding of system behaviour As illustrated by their award from the American Institute of Chemical Engineers for the best overall performance at the Fluid Simulation Challenge 2004 the authors are recognized experts in Monte Carlo simulation techniques which they use to address equilibrium properties This book presents these techniques in sufficient detail for readers to understand how simulation works and describes many applications for industrially relevant problems The book is primarily dedicated to chemical engineers who are not yet conversant with molecular simulation techniques In addition specialists in molecular simulation will be interested in the large scope of applications presented including fluid properties fluid phase equilibria adsorption in zeolites etc

Coverage For some time we have contemplated a comprehensive review of the structures and force fields of the binary fluorides This bibliography of 1498 references marks the first step of that effort We are publishing this material now rather than waiting until the review is complete some two years hence because we believe that the information already accumulated will be of immediate use to a broad spectrum of researchers Anyone ambitious enough to read through all the articles on binary fluorides will find that the structures and force fields of many of these molecules are at present unknown For example it has not been clearly established to which point groups the lanthanide trifluorides should be assigned There remain interesting problems relating to the role of Jahn Teller and pseudo Jahn Teller distortions in some of the transition metal fluorides such as VF MoF ReF and ReF to name only a few One also finds fascinating examples of large amplitude motions or pseudorotations as they are often called in such molecules as XeF₆ IF₇ and PF₅ For those binary fluorides whose equilibrium geometries are precisely known there still exists the problem of accurately determining the harmonic force field In a few cases most notably the Group VA trifluorides there has been some attempt made at extracting the cubic and quartic contributions to the force field
