Robot Shaping Marco Dorigo,Marco Colombetti,1998 foreword by Lashon Booker To program an autonomous robot to act reliably in a dynamic environment is a complex task The dynamics of the environment are unpredictable and the robots sensors provide noisy input A learning autonomous robot one that can acquire knowledge through interaction with its environment and then adapt its behavior greatly simplifies the designer s work A learning robot need not be given all of the details of its environment and its sensors and actuators need not be finely tuned Robot Shaping is about designing and building learning autonomous robots The term shaping comes from experimental psychology where it describes the incremental training of animals The authors propose a new engineering discipline behavior engineering to provide the methodologies and tools for creating autonomous robots Their techniques are based on classifier systems a reinforcement learning architecture originated by John Holland to which they have added several new ideas such as mutespec classifier system energy and dynamic population size In the book they present Behavior Analysis and Training BAT as an example of a behavior engineering methodology

Minimum Reinforcement in Concrete Members A. Carpinteri,1999-04-22 The ESIS Technical Committee 9 on Concrete was established in 1990 and has met seven times A proposal was put to European and extra European laboratories entitled Scale effects and transitional failure phenomena of reinforced concrete beams in flexure which lead to several positive responses The central topic discussed by the committee was that of the minimum reinforcement in concrete members The minimum amount of reinforcement is defined as that for which peak load at first concrete cracking and ultimate load after steel yielding are equal In this way any brittle behaviour is avoided as well as any localized failure if the member is not over reinforced In other words there is a reinforcement percentage range depending on the size scale within which the plastic limit analysis may be applied with its static and kinematic theorems Carpinteri Ferro Bosco and El Katieb propose a LFRM model according to which reinforcement reactions are applied directly on the crack surfaces and a compatibility condition is locally imposed on the crack opening displacement in correspondence with the reinforcement The theoretical model is found to provide a satisfactory estimate of the minimum percentage of reinforcement that depends on the scale and enables the element in flexure to prevent brittle failure
