intractable chemical problems to be solved using rigorous quantum mechanical methods This is the first comprehensive up to date and technical work to cover all the important aspects of modern molecular electronic structure theory Topics covered in the book include Second quantization with spin adaptation Gaussian basis sets and molecular integral evaluation Hartree Fock theory Configuration interaction and multi configurational self consistent theory Coupled cluster theory for ground and excited states Perturbation theory for single and multi configurational states Linear scaling techniques and the fast multipole method Explicitly correlated wave functions Basis set convergence and extrapolation Calibration and benchmarking of computational methods with applications to molecular equilibrium structure atomization energies and reaction enthalpies Molecular Electronic Structure Theory makes extensive use of numerical examples designed to illustrate the strengths and weaknesses of each method treated In addition statements about the usefulness and deficiencies of the various methods are supported by actual examples not just model calculations Problems and exercises are provided at the end of each chapter complete with hints and solutions This book is a must for researchers in the field of quantum chemistry as well as for nonspecialists who wish to acquire a thorough understanding of ab initio molecular electronic structure theory and its applications to problems in chemistry and physics It is also highly recommended for the teaching of graduates and advanced undergraduates
