* 3 Classes of Dienes.

① Conjugated dienes = double bonds separated by one single bond.

② Cumulenes ("allenes") = compounds with double bonds that share a single sp-hybridized carbon.

③ Other Isolated Double Bonds = nothing special here.

* Relative Stabilities of Dienes.

Displacement-based Seismic Design of Reinforced Concrete Buildings fib Fédération internationale du béton, 2003 A brief summary of the history of seismic design as given in chapter 1 indicates that initially design was purely based on strength or force considerations When the importance of displacement however became better appreciated it was attempted to modify the existing force based approach in order to include considerations of displacement rather than to totally reconsider the procedure on a more rational basis In the last decade then several researchers started pointing out this inconsistency proposing displacement based approaches for earthquake engineering evaluation and design with the aim of providing improved reliability in the engineering process by more directly relating computed response and expected structural performance The main objective of this report is to summarize critically review and compare the displacement based approaches proposed in the literature thus favouring code implementation and practical use of rational and reliable methods Chapter 2 Seismic performance and design objectives of this report introduces concepts of performance levels seismic hazard representation and the coupling of performance and hazard to define performance objectives In fact for displacement analysis to be relevant in the context of performance based design the structural engineer must select appropriate performance levels and seismic loadings A critical review of some engineering limit states appropriate to the different performance levels is therefore proposed In chapter 3 Conceptual basis for displacement based earthquake resistant design the fundamental principles associated with displacement of the ground during an earthquake and the effects in terms of displacement in the structure are reviewed The historical development guides the presentation with a review of general linear and nonlinear structural dynamics principles general approaches to estimate displacement for both ground and

structure and finally a general presentation of the means to measure and judge the appropriateness of the displacements of the structure in section Chapter 4 Approaches and procedures for displacement based design can be somehow considered the fundamental part of the report since a critical summary of the displacement based approaches proposed by different researchers is presented there Displacement based design may require specific characterization of the input ground motion a topic addressed in Chapter 5 Seismic input In general various pertinent definitions of input motion for non code format analysis are included while peak ground parameters necessary for code base shear equations are only addressed as needed for the definition of motion for analysis Chapter 6 Displacement capacity of members and systems addresses the fundamental problem of evaluating the inelastic displacement capacity of reinforced concrete members and realistic values of their effective cracked stiffness at yielding including effects of shear and inclined cracking anchorage slip bar buckling and of load cycling In Chapter 7 Application and evaluation of displacement based approaches some of the many different displacement based design procedures briefly introduced in Chapter 4 are applied to various case studies identifying and discussing the difficulties a designer may encounter when trying to use displacement based design Results for five different case studies designed in accordance with eight different displacement based design methods are presented Although in general case studies are considered a useful but marginal part of a state of the art document in this case it has to be noted that chapter 7 is possibly the most innovative and fundamental part of the whole report The conclusions of chapter 7 are the fundamental and essential conclusions of the document and allow foreseeing a bright future for displacement based design approaches The state of art report has been elaborated over a period of 4 years by Task Group 7 2 Displacement based design and assessment of fib Commission 7Seismic design a truly international team of experts representing the expertise and experience of all the important seismic regions of the world In October 2002 the final draft of the Bulletin was presented to the public during the 1st fibCongress in Osaka It was also there that it was approved by fib Commission 7Seismic Design

Soil Nailing Raymond Cheung,Ken Ho,2021-03-11 Soil nailing is an in situ soil reinforcement technique that can be used to enhance the stability of slopes retaining walls embankments and excavations It involves installation of closely spaced relatively slender unstressed tension carrying structural elements into the ground to stabilize the soil mass These elements which are called soil nails comprise steel or other engineering materials such as fiber reinforced polymer Soil nailing did not gain popularity until the 1970s when engineers started to realize that the technique could offer an effective robust and economical reinforcing system for a variety of ground conditions More importantly the track record has been excellent in that no major collapses have been reported in properly designed and well constructed soil nailed structures so far Considerable experience and knowledge of the technique have been gained in the past few decades through systematic technical development work comprising laboratory tests numerical modeling physical modeling site trials and field monitoring covering design and construction practices Soil Nailing A Practical Guide consolidates the experience and advances made in the

development and use of the soil nailing technique and encourages a wider adoption of the technique by practitioners The book is intended for use by postgraduate students researchers and practicing civil and geotechnical engineers who wish to have a more in depth and fundamental understanding of the theory and practice behind the technique It presents the basic principles of the technique as well as state of the art knowledge and recommended standard of good practice in respect of design construction monitoring and maintenance of soil nailed structures
