Liquid Natural Gas in the United States John Hrastar, 2014-06-24 When natural gas was first discovered in Appalachia in the 19th century its development as a fuel was rapid Unlike oil and coal gas could be moved only by pipeline and required large containers for storage It was not possible to cope with peak loads without adding excessive pipeline capacity until just before World War II when two sister gas companies developed a plant to liquefy and store natural gas as a liquid the liquid was then regasified to deal with peak loads The liquid is 1/600 the volume of the gas but it requires storage at an extremely low temperature 1/260 F This worked well until 1944 when a liquid natural gas LNG tank in Cleveland ruptured and caused a fire with 130 fatalities The fire did not end the industry but caused it to pause Over the next few years the problems in materials design standards and siting were solved The recognition that liquefaction made LNG transportable without a pipeline was the breakthrough In 1959 a shipload of LNG went from Louisiana to Britain and restarted the LNG industry It is now a major worldwide energy industry and the topic of this work
