

IP1 Topic 3: Motions and Forces

- Displacement: a straight line from start to finish. It is a quantity with a certain direction as it must go in a straight line.
- Speed: How fast you have got to an object will travel a certain distance. It can be defined by the following equation: $\text{speed (m/s)} = \frac{\text{distance (m)}}{\text{time (s)}}$
- Velocity: How fast you have got to an object in moving but also which direction the object is moving.
- Displacement like displacement and velocity are vector quantities as they both have a size and a direction.
- Force is also a vector quantity. For example, on the Earth the weight of an object is always pulled vertically downwards.

Distance-time graphs

- A graph in which distance is plotted against time is called a distance-time graph. The time and distance are both vector quantities (speed). The graph can tell you a lot of things about speed:
 - Horizontal lines - stationary object
 - At right, sloping lines mean the object is travelling at constant speed
 - Steeper the line - faster the object is travelling
 - Curves represent acceleration and deceleration. Travelling off means slowing down
 - Downhill means going back to the starting point
 - Speed can be calculated from the gradient of the line
 - $\text{speed (m/s)} = \frac{\text{distance (m)}}{\text{time (s)}}$

Acceleration

- Acceleration: A change in velocity in a moving object. It is a vector quantity as it has a magnitude and a direction.
- Acceleration can be calculated using the following equation: $\text{acceleration (m/s}^2\text{)} = \frac{\text{change in velocity (m/s)}}{\text{time (s)}}$
- It is written in symbols as $a = \frac{\Delta v}{\Delta t}$ where:
 - a is the acceleration
 - v is the final velocity
 - u is the initial velocity
 - t is the time taken for the change in velocity
