Precambrian Continents and Plate Tectonics

Content of Cratons

Little is known about the **paleogeography**, or ancient geography, of early Earth. The earliest continental crust is found in **cratons**, which are the ancient cores on continents. They also contain all three types of rocks that each tells their own story about the Precambrian era.

- Felsic igneous rocks are the remains of the first continents.
- Rounded sedimentary grains show that early rivers and seas existed and that erosion occurred.
- **Greenstone**, a metamorphic volcanic rock, shows the location of subduction zones because they are found in ocean trenches

Study Tip

The forming of continents was similar to the forming of our planets: Many small pieces (microcontinents) collided to create bigger pieces.

Notice the greenstone lining the Canadian shield, which has been exposed by the scraping of glaciers.

Formation from Cratons

Shields are where cratons crop out at the surface. Many Precambrian shields are about 570 million years old. Cratons covered by younger rocks are called **platforms**. When these platforms undergo erosion, the Precambrian craton is exposed.

Early Crustal Plates

Early crustal plates were small due to faster mantle convection and stronger plate tectonics processes. These processes also created more subduction zones.

Plate Tectonics

Plate tectonics: Smaller **microcontinents** collided to create bigger **supercontinents**, which resulted in the formation of massive mountain ranges. An active period of convergence was between 1.5 million and 1.0 million years ago. Cratons collided with microcontinents and oceanic island arcs to form Laurentia, which is part of the supercontinent Rodinia. Around 750 million years ago, oceans began forming in between continents as the result of Rodinia's disintegration.

The supercontinent Rodinia 1.1 billion years ago

Brasier,D. McIlroy,N. McLoughlin,2017-06-09 This volume in memory of Professor Martin Brasier which has many of his unfinished works summarizes recent progress in some of the hottest topics in palaeobiology including cellular preservation of early microbial life and early evolution of macroscopic animal life encompassing the Ediacara biota The papers focus on how to decipher evidence for early life which requires exceptional preservation employment of state of the art techniques and also an understanding gleaned from Phanerozoic lagersttte and modern analogues The papers also apply Martin s MOFAOTYOF principle my oldest fossils are older than your oldest fossils requiring an integrated approach to understanding fossils The adoption of the null hypothesis that all putative traces of life are abiotic until proven otherwise and the consideration of putative fossils within their spatial context characterized the work of Martin Brasier as is well demonstrated by the papers in this volume **Early Life on Earth** David Wacey,2009-01-29 When did life first appear on Earth and what form did it take The answer to this intriguing and fundamentally important question lies somewhere within the early Archean rock record The young Earth was however a very different place to that we know today and numerous pitfalls await our interpretation of these most ancient rocks The first half of this practical guide equips the reader with the

background knowledge to successfully evaluate new potentially biological finds from the Archean rock record Successive steps are covered from locating promising samples in the field through standard petrography and evaluation of antiquity and biogenicity criteria to the latest state of the art geochemical techniques The second half of the guide uniquely brings together all the materials that have been claimed to comprise the earliest fossil record into an easily accessible fully illustrated format This will be a handbook that every Archean geologist palaeobiologist and astrobiologist will wish to have in their backpack or on their lab bench *Selected Studies of Archean Gneisses and Lower Proterozoic Rocks, Southern Canadian Shield* G.
