Solving Proportions

A proportion is an equation that states that two ratios are equal. If a quantity in a proportion is unknown, you can solve a proportion to find the unknown quantity as shown below.

Problem

What is the solution of $\frac{3}{4} = \frac{x}{14}$?

There are two methods for solving proportions—using the Multiplication Property of Equality and the Cross Products Property.

- 1) The Multiplication Property of Equality says that you can multiply both sides of an equation by the same number without changing the value.

$$\begin{aligned}\frac{3}{4} &= \frac{x}{14} \\ 14\left(\frac{3}{4}\right) &= 14\left(\frac{x}{14}\right) \\ \frac{42}{4} &= x \\ 10.5 &= x\end{aligned}$$

To isolate x , multiply each side by 14.

Simplify.

Divide 42 by 4.

- 2) The Cross Products Property says that you can multiply diagonally across the proportion and these products are equal.

$$\begin{aligned}\frac{3}{4} &= \frac{x}{14} \\ (4)(x) &= (3)(14) \\ 4x &= 42 \\ \frac{4x}{4} &= \frac{42}{4} \\ x &= 10.5\end{aligned}$$

Multiply diagonally across the proportion.

Multiply.

To isolate x , divide each side by 4.

Simplify.

Real world situations can be modeled using proportions.

Problem

A bakery can make 6 dozen donuts every 21 minutes. How many donuts can the bakery make in 2 hours?

A proportion can be used to answer this question. It is key for you to set up the proportion with matching units in both numerators and both denominators.

For this problem, you know that 2 hours is 120 minutes and 6 dozen is 72 donuts.

Correct:

$$\frac{72 \text{ donuts}}{21 \text{ min}} = \frac{x \text{ donuts}}{120 \text{ min}}$$

Incorrect:

$$\frac{72 \text{ donuts}}{21 \text{ min}} = \frac{120 \text{ min}}{x \text{ donuts}}$$

It also presents Buchberger's algorithm, which is one of the important algorithms for constructing Gröbner basis. **Key Features:** Covers all major topics of classical theory of modern abstract algebra such as groups, rings, and fields and their applications. In addition, it provides the introduction to the number theory, theory of finite fields, finite dimensional algebras, and their applications. Provides interesting and important modern applications in such subjects as Cryptography, Coding Theory, Computer Science, and Physics. Presents numerous examples illustrating the theory and applications. It is also filled with a number of exercises of various difficulty. Describes in detail the construction of the Cayley-Dickson construction for finite dimensional algebras, in particular algebras of quaternions and octonions, and gives their applications in the number theory and computer graphics.

EEG Signal Processing Saeid Sanei, Jonathon A.

Chambers, 2013-05-28 Electroencephalograms (EEGs) are becoming increasingly important measurements of brain activity, and they have great potential for the diagnosis and treatment of mental and brain diseases and abnormalities. With appropriate interpretation methods, they are emerging as a key methodology to satisfy the increasing global demand for more affordable and effective clinical and healthcare services. Developing and understanding advanced signal processing techniques for the analysis of EEG signals is crucial in the area of biomedical research. This book focuses on these techniques, providing expansive coverage of algorithms and tools from the field of digital signal processing. It discusses their applications to medical data using graphs and topographic images to show simulation results that assess the efficacy of the methods. Additionally, expect to find explanations of the significance of EEG signal analysis and processing with examples and a useful theoretical and mathematical background for the analysis and processing of EEG signals, an exploration of normal and abnormal EEGs, neurological symptoms and diagnostic information, and representations of the EEGs, reviews of theoretical approaches in EEG modelling such as restoration, enhancement, segmentation, and the removal of different internal and external artefacts from the EEG and ERP event-related potential signals, coverage of major abnormalities such as seizure and mental illnesses such as dementia, schizophrenia, and Alzheimer's disease, together with their mathematical interpretations from the EEG and ERP signals, and sleep phenomenon, descriptions of nonlinear and adaptive digital signal processing techniques for abnormality detection, source localization, and brain-computer interfacing using multi-channel EEG data with emphasis on non-invasive techniques, together with future topics for research in the area of EEG signal processing. The information within EEG Signal Processing has the potential to enhance the clinically related information within EEG signals.
