Learning Through Teaching Mathematics Roza Leikin,Rina Zazkis,2010-04-10 The idea of teachers Learning through Teaching LTT when presented to a naive bystander appears as an oxymoron Are we not supposed to learn before we teach After all under the usual circumstances learning is the task for those who are being taught not of those who teach However this book is about the learning of teachers not the learning of students It is an ancient wisdom that the best way to truly learn something is to teach it to others Nevertheless once a teacher has taught a particular topic or concept and consequently truly learned it what is left for this teacher to learn As evident in this book the experience of teaching presents teachers with an exciting opportunity for learning throughout their entire career This means acquiring a better understanding of what is being taught and moreover learning a variety of new things What these new things may be and how they are learned is addressed in the collection of chapters in this volume LTT is acknowledged by multiple researchers and mathematics educators In the first chapter Leikin and Zazkis review literature that recognizes this phenomenon and stress that only a small number of studies attend systematically to LTT processes The authors in this volume purposefully analyze the teaching of mathematics as a source for teachers own learning **Python Data Analysis** Avinash Navlani,Armando Fandango,Ivan Idris,2021-02-05

Abstract Algebra and Famous Impossibilities Arthur Jones,Sidney A. Morris,Kenneth R. Pearson,2012-12-06 The famous problems

of squaring the circle doubling the cube and trisecting an angle captured the imagination of both professional and amateur mathematicians for over two thousand years Despite the enormous effort and ingenious attempts by these men and women the problems would not yield to purely geometrical methods It was only the development of abstract algebra in the nineteenth century which enabled mathematicians to arrive at the surprising conclusion that these constructions are not possible In this book we develop enough abstract algebra to prove that these constructions are impossible Our approach introduces all the relevant concepts about fields in a way which is more concrete than usual and which avoids the use of quotient structures and even of the Euclidean algorithm for finding the greatest common divisor of two polynomials Having the geometrical questions as a specific goal provides motivation for the introduction of the algebraic concepts and we have found that students respond very favourably We have used this text to teach second year students at La Trobe University over a period of many years each time refining the material in the light of student performance
