Calorimetric Methods for the Characterization of Porous Materials Juan Carlos Moreno-Piraján, Liliana Giraldo Gutiérrez, Fernando Gómez-Granados, Diana Cristina Hernández-Monje, 2024-04-01 Calorimetric Methods for the Characterization of Porous Materials presents calorimetric methods used in the characterization of porous materials using chemical thermodynamics Among these materials catalysts supports and adsorbents such as Activated Carbon Metal Organic Frameworks SBA 15 Zeolites Graphene Graphite Carbon Foams are presented In addition the use of calorimetry in the study of catalytic reactions in different phases is explored applicable to air and wastewater treatment clean and renewable energies green chemistry as well as energy production and storage Carbon dioxide methane and hydrogen at high pressure Chapters summarize basic concepts of thermodynamics and kinetics alongside experimental techniques such as thermal analysis and calorimetry In addition information is given about different calorimetric methods that can be used in studies aimed at characterizing the physicochemical properties of adsorbents supports and solid catalysts as well as the processes related to the adsorption desorption phenomena of the reactants and or products of catalytic reactions Addresses the problems involved with the chemical thermodynamics of porous materials with a significant practical element explaining experimental parameters and how to perform calculations Presents in detail the main instrumental calorimetric methods including those that must be carefully considered to avoid experimental errors Demonstrates step by step how to perform calculations using data obtained from instrumentation to achieve reliable results Provides novel explanations on how to use calorimetry in catalyst characterization Allows readers to broaden the spectrum of the application of calorimetry in the study of materials

A Tutorial on the WKB Approximation for Innovative Dirac Materials Andrii Iurov, 2024-08-30 This textbook serves to supplement existing quantum mechanics courses with the WKB Wentzel Kramers Brillouin theory for recently discovered Dirac materials such as graphene a dice lattice and alpha T3 materials This includes finding the semiclassical wave function coordinate dependent momentum semiclassical action the complete set of transport equations and applicability conditions for the approximation The discovery of graphene and its unique electronic behavior has transformed research in condensed matter physics over the last 10 15 years but core curriculum in standard graduate level physics courses still does not reflect these new developments and this book intends to close this gap With a clear focus on various types of Dirac Hamiltonians the multidimensional theory is only a small part of the book The derivation of the WKB equations for novel Dirac materials and their applications to electron tunneling turning points and classically forbidden regions resonances and localized states and many other crucial physical problems are methodically presented This textbook aims to expand the existing approach to presenting the WKB approximation and covers recent developments in its applications This book also includes many informative graphics as well as problems and exercises with hints at the end of each chapter Additional detailed

mathematical derivations as well as code in Mathematica are added throughout the whole book Ideal for graduate students and researchers in condensed matter physics this textbook serves as a modern guide for learning the WKB theory
