

PHYSICAL AND CHEMICAL CHANGES LAB- virtual

Pre-Lab Discussion:

Chemistry is the study of matter and the changes it undergoes. These changes can be divided into 2 classes: physical changes and chemical changes.

In a physical change, one or more physical properties of a substance are altered. Examples of such physical properties are: size, shape, color, and state of matter. Grinding, melting, dissolving, and evaporating are all physical changes. No new substance or substances are formed as a result of a physical change.

A chemical change results in the formation of one or more "new" substances. These new substances differ in chemical properties and composition from the original substance. Iron rusting and paper burning are two examples of chemical change. 5 signs of a chemical change are formation of bubbles (gas produced), formation of a precipitate (solid formed), change of color, change of temperature or production of an odor.

This experiment will help you understand the differences between physical and chemical changes and to recognize each type of change when it occurs.

Station 1 video
