their limits whenever the full spectrum of user requirements cannot be anticipated or the frequency of changes makes software reengineering cycles too clumsy to address all the needs of a specific field of application. Moreover, the increasing importance of infrastructural aspects, particularly the mutual dependencies between technologies, usages and domain competencies, calls for a differentiation of roles beyond the classical user designer dichotomy. End user development (EUD) addresses these issues by offering lightweight use time support which allows users to configure, adapt and evolve their software by themselves. EUD is understood as a set of methods, techniques and tools that allow users of software systems who are acting as non professional software developers to 1. create, modify or extend a software artifact. While programming activities by non professional actors are an essential focus, EUD also investigates related activities such as collective understanding and sense making of use problems and solutions, the interaction among end users with regard to the introduction and diffusion of new configurations or delegation patterns that may also partly involve professional designers.
