## Purpose

This document describes how to install and distribute SAP front end components on Windows using SAPSetup.

## 1. Introduction

This section contains information about the features and the SAP Notes that are relevant for installing and distributing SAP front end components.

### 1.1. Overview

This section describes the general features of SAPSetup:

- Fully-featured installation, uninstallation, update, repair, and patch functions for SAP front end components:
  - Front end components are available from an installation server or a distribution medium such as a DVD.
  - Install new SAP front end components, uninstall existing ones, and update the remaining components in one cycle.
- Easier and more reliable handling of SAP front end components by using installation servers:
  - Maintain nearly all Windows-based SAP front end components on a single installation server.
  - Integrate additional SAP front end components into an existing installation server, such as *Import Product*.
  - Deploy multiple SAP front end components on workstations using a single command.
  - Easily manage the installation server with wizard-driven user interfaces.
  - Local Security Handling (LSH), when configured, lets you deploy SAP front end components on workstations without requiring administrator privileges on all machines.
  - Whenever installed SAP front end components or packages change on the installation server, the automatic workstation update service (AWUS) will, once configured, automatically update the workstations and reboot them if necessary.
  - Easier handling of multiple SAP front end components by configuration of installation packages – by implementing script events, you can customize and extend the installation of such packages.
  - Controlling workstations remotely helps you to remotely access and control workstations on which you have administrator privileges. You can collect remote log files, execute processes remotely, and list remote processes.
  - The directory for the creation of the installation server is configured automatically. By default, it is made NULL-session accessible. It can be shared automatically on the network for everyone to read.
  - If `%SapSetup.exe` is started from a batch file, the return code can be caught by the environment variable `%ErrorLevel%`.
