Problem Solutions

Chapter 2 (Bayesian Decision Theory)

Problem 11 (randomized rules)

Part (a): Let $R(x)$ be the average risk given measurement x . Then since this risk depends on the action and correspondingly the probability of taking such action, this risk can be expressed as

$$R(x) = \sum_{i=1}^m R(a_i|x)P(a_i|x)$$

Then the total risk (over all possible x) is given by the average of $R(x)$ or

$$R = \int_{\Omega_x} \left(\sum_{i=1}^m R(a_i|x)P(a_i|x) \right) p(x) dx$$

Part (b): One would pick

$$P(a_i|x) = \begin{cases} 1 & i = \text{ArgMin}_i R(a_i|x) \\ 0 & i = \text{anything else} \end{cases}$$

Thus for every x pick the action that minimizes the local risk. This amounts to a deterministic rule i.e. there is no benefit to using randomness.

Abductive Inference Models for Diagnostic Problem-Solving Yun Peng, James A. Reggia, 2012-12-06 Making a diagnosis when something goes wrong with a natural or man-made system can be difficult. In many fields such as medicine or electronics, a long training period and apprenticeship are required to become a skilled diagnostician. During this time, a novice diagnostician is asked to assimilate a large amount of knowledge about the class of systems to be diagnosed. In contrast, the novice is not really taught how to reason with this knowledge in arriving at a conclusion or a diagnosis, except perhaps implicitly through case examples. This would seem to indicate that many of the essential aspects of diagnostic reasoning are a type of intuition-based common sense reasoning. More precisely, diagnostic reasoning can be classified as a type of inference known as abductive reasoning or abduction. Abduction is defined to be a process of generating a plausible explanation for a given set of observations or facts. Although mentioned in Aristotle's work, the study of formal

aspects of abduction did not really start until about a century ago

Numerical Linear Approximation in C Nabih Abdelmalek, William A. Malek, 2008-05-19 Illustrating the relevance of linear approximation in a variety of fields Numerical Linear Approximation in C presents a unique collection of linear approximation algorithms that can be used to analyze model and compress discrete data Developed by the lead author the algorithms have been successfully applied to several engineering projects at the National Research Council of Canada Basing most of the algorithms on linear programming techniques the book begins with an introductory section that covers applications the simplex method and matrices The next three parts focus on various L1 Chebyshev and least squares approximations including one sided bounded variables and piecewise The final section presents the solution of underdetermined systems of consistent linear equations that are subject to different constraints on the elements of the unknown solution vector Except in the preliminary section all chapters include the C functions of the algorithms along with drivers that contain numerous test case examples and results The accompanying CD ROM also provides the algorithms written in C code as well as the test drivers To use the software it is not required to understand the theory behind each function

Computational Models of Learning Leonard Bolc, 2012-12-06 In recent years machine learning has emerged as a significant area of research in artificial intelligence and cognitive science At present research in the field is being intensified from both the point of view of theory and of implementation and the results are being introduced in practice Machine learning has recently become the subject of interest of many young and talented scientists whose bold ideas have greatly contributed to the broadening of knowledge in this rapidly developing field of science This situation has manifested itself in an increasing number of valuable contributions to scientific journals However such papers are necessarily compact descriptions of research problems Computational Models of Learning supplements these contributions and is a collection of more extensive essays These essays provide the reader with an increased knowledge of carefully selected problems of machine learning

New Solutions for an Old Challenge Ronny Merkel, 2014 In criminal investigations latent fingerprints are often considered as reliable means of identifying suspects However the evidential value of a print is strongly dependent on the knowledge of its age the time which has passed since deposition Suspects might admit their previous presence at a crime scene but often claim to have been there prior to or after the crime Especially in regard to public or highly frequented crime scenes prints might lose their evidential value in this case potentially leading to dropped charges Despite its high relevance the challenge of estimating a latent print's age could not be adequately addressed for 80 years In this thesis non invasive high resolution capturing devices are for the first time applied to the age estimation challenge replacing classical physical or chemical print development techniques They allow to capture a single print in regular time intervals and to systematically study its degradation behavior Introducing automated processing methods in the form of a digital pipeline including preprocessing feature extraction and age estimation techniques objective age estimates are presented for the first time in this field Maximum classification performances of different capturing devices between 76% and 86% are achieved for two class problems Furthermore a qualitative influence model on the aging speed of latent prints is designed forming a prerequisite for future studies
