last two decades and many important mechanisms controlling gene expression at the transcriptional level have been elucidated. However, control of gene expression is by no means complete once the RNA has been produced. Important regulatory devices determine the maturation and usage of mRNA and the fate of its translation product. Post transcriptional regulation is especially important for generating a fast response to environmental and intracellular signals. This book summarizes recent progress in the area of post transcriptional regulation of gene expression in plants. 18 chapters of the book address problems of RNA processing and stability, regulation of translation, protein folding and degradation as well as intracellular and cell to cell transport of proteins and nucleic acids. Several chapters are devoted to the processes taking place in plant organelles.

Educational Psychology Steven R. Wininger, Antony D. Norman, Bruce W. Tuckman, 2025-01-07

Educational Psychology distills the latest research into actionable steps to help students build a solid evidence based teaching plan as they prepare to go into the classroom. This text takes a meta cognitive approach asking students to think about their dual role as both teachers and learners so they can understand not just what to do in the classroom but the why behind it. Motivation is at the heart of Educational Psychology. The authors address the challenges of fostering motivation by offering a practical framework for teachers. This text helps teachers enhance student motivation and links it to other key themes and concepts discussed in the book. Rather than taking an encyclopedic approach, the authors group chapters by topic to help readers remember concepts and connect best practices to big ideas in educational psychology. The text blends scholarship with application by using vignettes, examples, case studies and practical teaching strategies so students be both methodical and creative in their future classrooms.

Structure-Function Relations of Warm Desert Plants Arthur C. Gibson, 2012-12-06

For centuries biologists have been extremely interested in the structure of desert plants as examples of natural selection to harsh environmental conditions. Indeed, desert plants are frequently used as examples in many biology classes and textbooks to illustrate natural selection, but this has led to an unfortunate litany of errors and misconceptions about desert plant adaptations. This new synthesis focuses on plants of lowland tropical and subtropical arid deserts. Readers will be surprised to discover that many features commonly ascribed to desert plants are rarely observed in the most common species. Instead, the typical structural adaptations of nonsucculent warm desert plants are now viewed as ways to maximize photosynthetic rate.
