## Layers of the Atmosphere: An Exploration

The Earth's atmosphere is divided into five major layers, each with unique characteristics and functions. Understanding these layers is crucial for grasping how our planet's environment works.

**Troposphere:** The lowest layer, extending from the surface up to about 10-12 km. It's where most weather occurs, and temperature decreases with altitude.

**Stratosphere:** The layer above the troposphere, extending up to about 50 km. Temperature increases with altitude due to the presence of ozone.

**Mesosphere:** The layer above the stratosphere, extending up to about 85 km. Temperature decreases with altitude.

**Thermosphere:** The layer above the mesosphere, extending up to about 600 km. Temperature increases with altitude due to the absorption of high-energy solar radiation.

**Exosphere:** The outermost layer, extending from the top of the thermosphere into space. It's the least dense layer and contains very few molecules.
