Ch.1 - Introduction

- An OS is a program that acts as an intermediary between a user of a computer and the computer hardware
- Goals: Execute user programs, make the comp. system easy to use, utilize hardware efficiently
- Computer system: Hardware ↔ OS ↔ Applications ↔ Users (↔ = 'uses')
- OS is:
 - Resource allocator: decides between conflicting requests for efficient and fair resource use
 - Control program: controls execution of programs to prevent errors and improper use of computer
- **Kernel:** the one program running at all times on the computer
- **Bootstrap program:** loaded at power-up or reboot
 - Stored in ROM or EPROM (known as firmware). Initializes all aspects of system, loads OS kernel and starts execution
- I/O and CPU can execute concurrently
- Device controllers inform CPU that it is finished w/ operation by causing an interrupt
 - Interrupt transfers control to the interrupt service routine generally, through the interrupt vector, which contains the addresses of all the service routines
 - Incoming interrupts are disabled while another interrupt is being processed
 - Trap is a software generated interrupt caused by error or user request
 - OS determines which type of interrupt has occurred by polling or the vectorized interrupt system
- **System call:** request to the operating system to allow user to wait for I/O completion
- **Device status table:** contains entry for each I/O device indicating its type, address, and state
 - OS indexes into the I/O device table to determine device status and to modify the table entry to include interrupt
- Storage structure:
 - Main memory – random access, volatile
 - Secondary storage – extension of main memory That provides large non-volatile storage
 - Disk – divided into tracks which are subdivided into sectors. Disk controller determines logical interaction between the device and the computer.
- **Caching** – copying information into faster storage system
- **Multiprocessor Systems:** Increased throughput, economy of scale, increased reliability
 - Can be asymmetric or symmetric
 - Clustered systems – Linked multiprocessor systems
- **Multiprogramming** – Provides efficiency via job scheduling
 - When OS has to wait (ex: for I/O), switches to another job
- **Timesharing** – CPU switches jobs so frequently that each user can interact with each job while it is running (interactive computing)
- **Dual-mode** operation allows OS to protect itself and other system components – User mode and kernel mode
 - Some instructions are only executable in kernel mode, these are privileged
- Single-threaded processes have one program counter, multi-threaded processes have one PC per thread
- **Protection** – mechanism for controlling access of processes or users to resources defined by the OS
- **Security** – defense of a system against attacks
- **User IDs (UID)**, one per user, and **Group IDs**, determine which users and groups of users have which privileges
