• Higher zIIP utilization is good, because zIIP MIPS cost less than general-purpose MIPS, but don't let zIIP utilization get too high, or you could have significant amount of zIIP-eligible work running on general-purpose engines (may want to keep zIIP engine utilization under 60%)

• Some organizations looking to boost nighttime zIIP utilization are selectively binding batch packages with DEGREE(ANY) or using SYSQUERYOPTS catalog table for statement-level control of parallelization

Subsystem and Transaction Monitoring and Tuning with DB2 11 for z/OS Paolo Bruni, Felipe Bortoletto, Adrian Burke, Cathy Drummond, Yasuhiro Ohmori, IBM Redbooks, 2022-08-31 This IBM Redbooks publication discusses in detail the facilities of DB2 for z/OS which allow complete monitoring of a DB2 environment It focuses on the use of the DB2 instrumentation facility component IFC to provide monitoring of DB2 data and events and includes suggestions for related tuning We discuss the collection of statistics for the verification of performance of the various components of the DB2 system and accounting for tracking the behavior of the applications We have intentionally omitted considerations for query optimization they are worth a separate document Use this book to activate the right traces to help you monitor the performance of your DB2 system and to tune the various aspects of subsystem and application performance

InfoSphere Data Replication for DB2 for z/OS and WebSphere Message Queue for z/OS: Performance Lessons Miao Zheng, Ning Jiang Bin, Song Xiao Yu, Serge Bourbonnais, Yi Jin, IBM Redbooks, 2012-12-22 Understanding the impact of workload and database characteristics on the performance of both DB2 MQ and the replication process is useful for achieving optimal performance Although existing applications cannot generally be modified this knowledge is essential for properly tuning MQ and Q Replication and for developing best practices for future application development and database design It also helps with estimating performance objectives that take these considerations into account Performance metrics such as rows per second are useful but imperfect How large is a row It is intuitively and correctly obvious that replicating small DB2 rows such as 100 bytes long takes fewer resources and is more efficient than replicating DB2 rows that are tens of thousand bytes long Larger rows create more work in each component of the replication process The more bytes there are to read from the DB2 log makes more bytes to transmit over the network and to update in DB2 at the target Now how complex is the table definition Does DB2 have to maintain several unique indexes each

time a row is changed in that table The same argument applies to transaction size committing each row change to DB2 as opposed to committing say every 500 rows also means more work in each component along the replication process This Redpaper™ reports results and lessons learned from performance testing at the IBM laboratories and it provides configuration and tuning recommendations for DB2 Q Replication and MQ The application workload and database characteristics studied include transaction size table schema complexity and DB2 data type [Computerworld](#) ,1981-02-09

A major goal of operating systems is to process jobs while making the best use of system resources Thus one way of viewing operating systems is as resource managers Before job processing operating systems reserve input and output resources for jobs During job processing operating systems manage resources such as processors and storage After job processing operating systems free all resources used by the completed jobs making the resources available to other jobs This process is called resource management There is more to the processing of jobs than the managing of resources needed by the jobs At any instant a number of jobs can be in various stages of preparation processing and post processing activity To use resources
