Overview

Before beginning this section review with your students the objectives listed in the Student Edition. Tell students that the purpose of this lesson is to teach them about the general structural and physiological characteristics of mollusks, including their body plan and organ systems. They will also learn about distinguishing characteristics of the three major groups of mollusks: the gastropods, bivalves, and cephalopods.

TAKS 2 **8** **1C**

Bellringer

Ask students to think about a snail, a clam, and an octopus. Tell students that these are all mollusks. Ask them to write down some characteristics that these animals have in common. (Students will most likely note the prominent foot, or its modification.) **TAKS 2** **8** **1C**

Motivate

Identifying Preconceptions

BASIC

Ask students to hypothesize why some mollusks secrete a shell and others do not. Guide their thinking by asking how mollusks without shells might protect themselves. (Students should recall that squids and octopuses spray ink and can propel themselves away from danger. Slugs secrete noxious substances that discourage predators.) **TAKS 3** **8** **7B**

Objectives

- Summarize the evolutionary relationship between mollusks and annelids. **T8** **8B** **8C** **TAKS 3** **TAKS 9**

A True Coelom

While most of the simple invertebrates you read about in the last chapter may be unfamiliar to you, chances are good that you have seen many mollusks and annelids. Snails, slugs, oysters, clams, scallops, octopuses, and squids are all mollusks. If you have seen an earthworm, then you know what an annelid is. While a snail may not seem to have much in common with an earthworm, these two very different-looking animals are related.

Mollusks and annelids were probably the first major groups of organisms to develop a true coelom. (Recall that in animals that have a true coelom, or body cavity, the gut and other internal organs are suspended from the body wall and cushioned by the fluid within the coelom.) Another feature shared by mollusks and annelids is a larval stage called a **trochophore**. (TRAYK oh fere), which develops from the fertilized egg. In some species, the trochophore, shown in **Figure 1**, is free-swimming and propels itself through the water by movement of cilia on its surface. The presence of a trochophore larva in mollusks and annelids suggests that they share a common ancestor. **1** **2**

Members of the phylum Mollusca make up the second largest animal phyla, exceeded only by phylum Arthropoda. Mollusks are abundant in almost all marine, freshwater, and terrestrial habitats. There are more species of terrestrial mollusks than there are of terrestrial vertebrates. These mollusks often go unnoticed because people are not accustomed to looking for them. Seven classes of mollusks make up the phylum Mollusca. The three major classes are Gastropoda (snails and slugs), Bivalvia (clams, oysters, and scallops), and Cephalopoda (octopuses and squids). **1** **2**

Figure 1 Trochophore larva

The microscopic trochophore larva has a belt of cilia that circles its body. The beating of the cilia propels the trochophore through the water.

Evolutionary Milestone

3 Coelom

A true coelom develops entirely within the mesoderm. Contact between the mesoderm and endoderm during the development of the embryo leads to the development of complex organs.
