Quantum Computation and Quantum Information J. M. Landsberg, 2024-06-28 This book presents the basics of quantum computing and quantum information theory It emphasizes the mathematical aspects and the historical continuity of both algorithms and information theory when passing from classical to quantum settings The book begins with several classical algorithms relevant for quantum computing and of interest in their own right The postulates of quantum mechanics are then presented as a generalization of classical probability Complete rigorous and self contained treatments of the algorithms of Shor Simon and Grover are given Passing to quantum information theory the author presents it as a straightforward adaptation of Shannon's foundations to information theory Both Shannon's theory and its adaptation to the quantum setting are explained in detail The book concludes with a chapter on the use of representation theory in quantum

information theory It shows how all known entropy inequalities including the celebrated strong subadditivity of von Neumann entropy may be obtained from a representation theory perspective With many exercises in each chapter the book is designed to be used as a textbook for a course in quantum computing and quantum information theory Prerequisites are elementary undergraduate probability and undergraduate algebra both linear and abstract No prior knowledge of quantum mechanics or information theory is required

Robustness in Identification and Control M. Milanese,2013-06-29 This volume collects most of the papers presented at the International Workshop on Robustness in Identification and Control held in Torino Italy in 1988 The main focal point of the workshop was Unknown But Bounded uncertainty and associated robustness issues in identification and control Recent years have seen a growing interest in studying models which include un known but bounded uncertainty The motivation for dealing with such models is derived from robustness considerations In many applications some performance specification must be met for all admissible variations of the uncertain parameters A second motivation for models with this type of uncertainty stems from the fact that the statistical description of uncertain variables may not be well known or even not suitable For example in some cases only a small number of measurements is available and the resulting errors are due to analog digital conversion modelling approximation or round off so that a statistical description may actually be unreliable The interest in unknown but bounded setting is certainly not new In fact engineering practice demands for appropriate algorithms in dealing with finite sample properties finite parameter variations tolerance analysis etc Despite the natural need for such methods the lack of sufficiently well assessed theoretical results and algorithms prevented a systematic use of these procedures until recent years However in the last few years important advances have been made both in estimation theory
