Dominick Baier, Vittorio Bertocci, Keith Brown, Scott Densmore, Eugenio Pace, Matias Woloski, 2013-03-18 As an application designer or developer imagine a world where you don't have to worry about authentication Imagine instead that all requests to your application already include the information you need to make access control decisions and to personalize the application for the user In this world your applications can trust another system component to securely provide user information such as the user's name or e-mail address a manager's e-mail address or even a purchasing authorization limit The user's information always arrives in the same simple format regardless of the authentication mechanism whether it's Microsoft Windows integrated authentication forms based authentication in a Web browser an X.509 client certificate Windows Azure Access Control Service or something more exotic Even if someone in charge of your company's security policy changes how users authenticate you still get the information and it's always in the same format This is the utopia of claims based identity that *A Guide to Claims Based Identity and Access Control* describes As you'll see claims provide an innovative approach for building applications that authenticate and authorize users This book gives you enough information to evaluate claims based identity as a possible option when you're planning a new application or making changes to an existing one It is intended for any architect developer or information technology IT professional who designs builds or operates web applications web services or SharePoint applications that require identity information about their users

A Guide to Claims-based Identity and Access Control Dominick Baier, Vittorio Bertocci, Keith Brown, Matias Woloski, Eugenio Pace, 2010 As systems have become interconnected and more complicated programmers needed ways to identify parties across multiple computers One way to do this was for the parties that used applications on one computer to authenticate to the applications and or operating systems that ran on the other computers This mechanism is still widely used for example when logging on to a great number of Web sites However this approach becomes unmanageable when you have many co operating systems as is the case for example in the enterprise Therefore specialized services were invented that would register and authenticate users and subsequently provide claims about them to interested applications Some well known examples are NTLM Kerberos Public Key Infrastructure PKI and the Security Assertion Markup Language SAML Most enterprise applications need some basic user security features At a minimum they need to authenticate their users and many also need to authorize access to certain features so that only privileged users can get to them Some apps must go further and audit what the user does On Windows these features are built into the operating system and are usually quite easy to integrate into an application By taking advantage of Windows integrated authentication you don't have to invent your own authentication protocol or manage a user database By using access control lists ACLs impersonation and features such as groups you can implement authorization with very little code Indeed this advice applies no matter which OS you are using It's almost always a better idea to integrate closely with the security features in your OS rather than reinventing those features yourself But what happens when you want to extend reach to users who don't happen to have Windows accounts What about users who aren't running Windows at all More and

more applications need this type of reach which seems to fly in the face of traditional advice This book gives you enough information to evaluate claims based identity as a possible option when you re planning a new application or making changes to an existing one It is intended for any architect developer or information technology IT professional who designs builds or operates Web applications and services that require identity information about their users
