

Research Paper on Stop Bullying

Bullying refers to aggressive behavior of the victim or to create a feeling of fear, physical assaults, physical intimidation, teasing, social isolation, and exclusion from other forms of aggressive behavior. The nature of the bullying act, hence, not all students experience verbal insults by their level of bullying until the student time. The second characteristic that distinguishes bullying from other forms of aggressive behavior is the status inequality between bully and victim. In comparison, the victim is physically, psychologically, and socially more vulnerable, which allows the bully to engage in the behavior with little concern for reprisals or other consequences. For example, physical assaults might be classified as acts of bullying if the victims were selected because they lacked the resources to defend themselves due to their physical stature, psychological profile, or social skills.

intended to harm the physical well-being and intimidation. Bullying includes psychological intimidation, name-calling. Two characteristics distinguish bullying. The first is the repetitive and prolonged name-calling is a form of bullying. Many peers, but the name-calling does not rise to experiences it regularly over a period of

Until the 1970s, the problem of bullying received little attention from educators, researchers, or the general public. Bullying behavior was viewed as almost a rite of passage that most young people experience at some point during their childhood, adolescence, or both. Such a perception led to the belief that bullying behavior had no long-term consequences for either the victim or the bully. Today, the research suggests that neither perception is true. Both bullies and their victims are socially and psychologically different from their peers, and there are lasting implications for both. Not only has the traditional view of bullying as a rite of passage undermined our understanding of the causes and consequences of bullying, it may also have supported a "culture of bullying" within our education system.

Research suggests that the environment within schools is inadvertently supportive of bullying, thus creating a "culture of bullying." For a school's environment to be so described, it must possess two critical components that undermine the school's ability to act as a protector against bullying and instead allow development of a milieu that not only tolerates bullying behavior but also allows bullies to enhance their social standing through aggression without fear of consequences. First, it must possess an administration and faculty that are unaware of the extent of bullying behavior and therefore fail to effectively protect vulnerable students from being victimized or to punish those students who engage in bullying behavior. The research is consistent in suggesting that the schools' response to bullying is often ineffective in curbing the problem. In addition, schools rarely hold bullies responsible for their behavior when their behavior is brought to the attention of the faculty. This lack of effective response may be due to other social

Preventing Bullying Through Science, Policy, and Practice National Academies of Sciences, Engineering, and Medicine, Health and Medicine Division, Division of Behavioral and Social Sciences and Education, Committee on Law and Justice, Board on Children, Youth, and Families, Committee on the Biological and Psychosocial Effects of Peer Victimization: Lessons for Bullying Prevention, 2016-09-14 Bullying has long been tolerated as a rite of passage among children and adolescents There is an implication that individuals who are bullied must have asked for this type of treatment or deserved it Sometimes even the child who is bullied begins to internalize this idea For many years there has been a general acceptance and collective shrug when it comes to a child or adolescent with greater social capital or power pushing around a child perceived as subordinate But bullying is not developmentally appropriate it should not be considered a normal part of the typical social grouping that

occurs throughout a child's life. Although bullying behavior endures through generations, the milieu is changing. Historically, bullying has occurred at school, the physical setting in which most of childhood is centered and the primary source for peer group formation. In recent years, however, the physical setting is not the only place bullying is occurring. Technology allows for an entirely new type of digital electronic aggression: cyberbullying, which takes place through chat rooms, instant messaging, social media, and other forms of digital electronic communication. Composition of peer groups, shifting demographics, changing societal norms, and modern technology are contextual factors that must be considered to understand and effectively react to bullying in the United States. Youth are embedded in multiple contexts, and each of these contexts interacts with individual characteristics of youth in ways that either exacerbate or attenuate the association between these individual characteristics and bullying perpetration or victimization. Recognizing that bullying behavior is a major public health problem that demands the concerted and coordinated time and attention of parents, educators, and school administrators, health care providers, policy makers, families, and others concerned with the care of children, this report evaluates the state of the science on biological and psychosocial consequences of peer victimization and the risk and protective factors that either increase or decrease peer victimization behavior and consequences.
