How to Self-Assess Health-Related Fitness (HRF) Status, Barriers to Physical Activity Participation, and One's Diet.

5 components of Health-Related Fitness (HRF):

Body Composition

(also known as body fat percent) refers to the ratio between lean body mass and fat. The traditional method of measuring body fat is through skinfold measurements. It refers to the fat, bone, and muscle percentage in your body.

Muscular Endurance

Muscular endurance refers to the ability of a given muscle to exert force. Consistently and repetitively, over a period of time. Muscular endurance is how many times you can move that weight without getting exhausted (very tired).

Cardiorespiratory Endurance

Cardiorespiratory endurance is the ability to perform large-muscle, whole-body exercise at moderate to high intensities for extended periods of time (Saltin, 1973).

Muscular Strength

Refers to the greatest amount of force that can be generated from a single maximal effort. Muscular strength is the amount of force you put out or the amount of weight you can lift.

Flexibility

The ability of a joint or series of joints to move through an unrestricted, pain-free range of motion. These are activities that improve the ability of a joint to maintain the movement necessary for carrying out daily tasks and physical activity.

Barriers to Physical Activity Participation and One's Diet.

The biggest obstacle to a regular physical activity routine that most of us are aware of is a lack of time. Even though we have the best of intentions to be more active, work, family responsibilities, and other aspects of daily life frequently get in the way. There are many additional barriers that vary by the person and life circumstance such as lack of time, lack of motivation and/or energy, lack of resources/equipment, high costs, and lack of facilities.
