Emerging Memory and Computing Devices in the Era of Intelligent Machines Pedram Khalili Amiri, 2020-04-16 Computing systems are undergoing a transformation from logic centric towards memory centric architectures where overall performance and energy efficiency at the system level are determined by the density performance functionality and efficiency of the memory rather than the logic sub system This is driven by the requirements of data intensive applications in artificial intelligence autonomous systems and edge computing We are at an exciting time in the semiconductor industry where several innovative device and technology concepts are being developed to respond to these demands and capture shares of the fast growing market for AI related hardware This special issue is devoted to highlighting discussing and presenting the latest advancements in this area drawing on the best work on emerging memory devices including magnetic resistive phase change and other types of memory The special issue is interested in work that presents concepts ideas and recent progress ranging from materials to memory devices physics of switching mechanisms circuits and system applications as well as progress in modeling and design tools Contributions that

bridge across several of these layers are especially encouraged

Processor Description Languages Prabhat Mishra, Nikil Dutt, 2011-07-28 Efficient design of embedded processors plays a critical role in embedded systems design. Processor description languages and their associated specification exploration and rapid prototyping methodologies are used to find the best possible design for a given set of applications under various design constraints such as area, power, and performance. This book is the first comprehensive survey of modern architecture description languages and will be an invaluable reference for embedded system architects, designers, developers, and validation engineers. Readers will see that the use of particular architecture description languages will lead to productivity gains in designing particular application-specific types of embedded processors. Comprehensive coverage of all modern architecture description languages, use the right ADL to design your processor to fit your application. Most up-to-date information available about each architecture description language from the developers. Save time chasing down reliable documentation. Describes how each architecture description language enables key design automation tasks such as simulation, synthesis, and testing. Fit the ADL to your design cycle.

Domain Specific High-Level Synthesis for Cryptographic Workloads Ayesha Khalid, Goutam Paul, Anupam Chattopadhyay, 2019-03-28 This book offers an in-depth study of the design and challenges addressed by a high-level synthesis tool targeting a specific class of cryptographic kernels, i.e., symmetric key cryptography. With the aid of detailed case studies, it also discusses optimization strategies that cannot be automatically undertaken by CRYKET Cryptographic kernels toolkit. The dynamic nature of cryptography, where newer cryptographic functions and attacks frequently surface, means that such a tool can help cryptographers expedite the very large-scale integration VLSI design cycle by rapidly exploring various design alternatives before reaching an optimal design option. Features include flexibility in cryptographic processors to support emerging cryptanalytic schemes, area-efficient multinational designs supporting various cryptographic functions, and design scalability on modern graphics processing units (GPUs). These case studies serve as a guide to cryptographers exploring the design of efficient cryptographic implementations.

Algorithms and VLSI Implementations of MIMO Detection

Ibrahim A. Bello, Basel Halak, 2022-07-22 This book provides a detailed overview of detection algorithms for multiple input multiple output (MIMO) communications systems, focusing on their hardware realisation. The book begins by analysing the maximum likelihood detector, which provides the optimal bit error rate performance in an uncoded communications system. However, the maximum likelihood detector experiences a high complexity that scales exponentially with the number of antennas, which makes it impractical for real-time communications systems. The authors proceed to discuss lower complexity detection algorithms such as zero forcing, sphere decoding, and the K-best algorithm, with the aid of detailed algorithmic analysis and several MATLAB code examples. Furthermore, different design examples of MIMO detection algorithms and their hardware implementation results are presented and discussed. Finally, an ASIC design flow for implementing MIMO detection algorithms in hardware is provided, including the system simulation and modelling steps and register transfer level modelling.

using hardware description languages Provides an overview of MIMO detection algorithms and discusses their corresponding hardware implementations in detail Highlights architectural considerations of MIMO detectors in achieving low power consumption and high throughput Discusses design tradeoffs that will guide readers efforts when implementing MIMO algorithms in hardware Describes a broad range of implementations of different MIMO detectors enabling readers to make informed design decisions based on their application requirements
