Why do we see the same face of the moon?

Because the moon rotates around its axis at the same rate that it orbits Earth, we always see the same side of the moon. This is called synchronous rotation. The moon's rotation period is the same as its orbital period around Earth, which is approximately 27.3 days. This is why we always see the same side of the moon from Earth.

## The Moon

The moon is the only natural satellite of Earth. It is a rocky body that orbits Earth in a circular path. The moon is about 1/4 the size of Earth and is the only celestial body in the solar system that we can see with the naked eye. The moon's surface is covered in craters, mountains, and valleys. The moon's atmosphere is very thin and does not contain any oxygen. The moon's gravity is about 1/6 that of Earth's. The moon's temperature ranges from -150°C to 120°C. The moon's day and night last for about 14 Earth days each. The moon's phases are caused by the relative positions of the Earth, the moon, and the Sun.
