Abstract *Background:* The purpose of this study was to determine the prevalence of self-reported depression among the adult population in the United States. *Methods:* Data were obtained from the 2002 National Health and Medical Examination Survey, a nationally representative sample of the United States population. *Results:* The prevalence of self-reported depression was 10.1% among the adult population. The prevalence was higher among females than males, and among those with lower education and income. *Conclusions:* The prevalence of self-reported depression is high, and is associated with demographic factors. Further research is needed to determine the causes of depression and the best ways to treat it.
