equations of motion but that nevertheless exhibit nonpredictable behavior The detailed description of turbulent motions remains perhaps the outstanding unsolved problem of classical physics In recent years however a new theory has been formulated that succeeds in making quantitative predictions describing certain transitions to turbulence Its significance lies in its possible application to large classes often very dissimilar of nonlinear systems Since the publication of *Universality in Chaos* in 1984 progress has continued to be made in our understanding of nonlinear dynamical systems and chaos This second edition extends the collection of articles to cover recent developments in the field including the use of statistical mechanics techniques in the study of strange sets arising in dynamics It concentrates on the universal aspects of chaotic motions the qualitative and quantitative predictions that apply to large classes of physical systems Much like the previous edition this book will be an indispensable reference for researchers and graduate students interested in chaotic dynamics in the physical biological and mathematical sciences as well as engineering

Evolution and the Mechanisms of Decision Making Peter Hammerstein, Jeffrey R. Stevens, 2024-03-19 A multidisciplinary examination of cognitive mechanisms shaped over evolutionary time through natural selection that govern decision making How do we make decisions Conventional decision theory tells us only which behavioral choices we ought to make if we follow certain axioms In real life however our choices are governed by cognitive mechanisms shaped over evolutionary time through the process of natural selection Evolution has created strong biases in how and when we process information and it is these evolved cognitive building blocks from signal detection and memory to individual and social learning that provide the foundation for our choices An evolutionary perspective thus sheds necessary light on the nature of how we and other animals make decisions This volume with contributors from a broad range of disciplines including evolutionary biology psychology economics anthropology neuroscience and computer science offers a multidisciplinary examination of what evolution can tell us about our and other animals mechanisms of decision making Human children for example differ from chimpanzees in their tendency to over imitate others and copy obviously useless

actions this divergence from our primate relatives sets up imitation as one of the important mechanisms underlying human decision making The volume also considers why and when decision mechanisms are robust why they vary across individuals and situations and how social life affects our decisions *Algebraic Groups and Their Generalizations: Classical Methods*
