

Moon Note-Taking Guide

Why do we see the same face of the moon?

Although the moon rotates around its axis at the same rate that it orbits Earth, we always see the same side of the moon. This is because the moon is tidally locked to Earth. The moon's rotation period is the same as its orbital period, which is approximately 27.3 days. This means that the moon always shows the same face to Earth.

The moon's rotation is synchronized with its orbit around Earth. This is due to a process called tidal locking. As the moon orbits Earth, the gravitational pull of Earth creates a bulge on the side of the moon closest to Earth. This bulge is always pointed toward Earth, which is why we always see the same face of the moon.

By the time the moon has completed 1/4 of its orbit around Earth, its surface appears to be only half lit. We call this phase the first quarter. A waxing crescent can be seen just after the first quarter. The moon's surface is covered in craters of various sizes. The largest craters are located on the far side of the moon.

The Moon

The moon is the only natural satellite of Earth. It is a rocky body that orbits Earth. The moon is about 1/4 the size of Earth. It is covered in craters and has a thin atmosphere. The moon's surface is very dry and has no liquid water. The moon's gravity is about 1/6 that of Earth's. This means that objects on the moon weigh less than they do on Earth.

The moon's phases are caused by the way it reflects sunlight. The moon is always half lit by the sun. However, we only see the part of the moon that is lit and facing Earth. As the moon orbits Earth, the part of the moon that is lit and facing Earth changes. This is why we see different phases of the moon.

The phases of the moon are: New Moon, Waxing Crescent, First Quarter, Waxing Gibbous, Full Moon, Waning Gibbous, Last Quarter, and Waning Crescent. The moon's phases repeat every 29.5 days. This is called a lunar month. The moon's phases are important for many things, including agriculture and navigation.

The moon's surface is covered in craters of various sizes. The largest craters are located on the far side of the moon. The moon's surface is also covered in mountains and valleys. The moon's surface is very dry and has no liquid water. The moon's gravity is about 1/6 that of Earth's. This means that objects on the moon weigh less than they do on Earth.
