VLSI Design of Neural Networks Ulrich Ramacher, Ulrich Rückert, 2012-12-06 The early era of neural network hardware design starting at 1985 was mainly technology driven Designers used almost exclusively analog signal processing concepts for the recall mode Learning was deemed not to cause a problem because the number of implementable synapses was still so low that the determination of weights and thresholds could be left to conventional computers Instead designers tried to directly map neural parallelity into hardware The architectural concepts were accordingly simple and produced the so called interconnection problem which in turn made many engineers believe it could be solved by optical implementation in adequate fashion only Furthermore the inherent fault tolerance and limited computation accuracy of neural networks were claimed to justify that little effort is to be spend on careful design but most effort be put on technology issues As a result it was almost impossible to predict whether an electronic neural network would function in the way it was simulated to do This limited the use of the first neuro chips for further experimentation not to mention that real world applications called for much more synapses than could be implemented on a single chip at that time Meanwhile matters have matured It is recognized that isolated definition of the effort of analog multiplication for instance would be just as inappropriate on the part of the chip designer as determination of the weights by simulation without allowing for the computing accuracy that can be achieved on the part of the user

analysis in applications It is important to realize that the most difficult part of applying mathematical reasoning to a new problem domain is choosing the underlying mathematical framework to use on the problem Once that choice is made we have many tools we can use to solve the problem However a different choice would open up avenues of analysis from a different perhaps more productive perspective In this volume the nature of these critical choices is discussed using applications involving the immune system and cognition Features Develops a proof of the Jordan Canonical form to show some basic ideas in algebraic topology Provides a thorough treatment of topological spaces finishing with the Krein Milman theorem Discusses topological degree theory Brouwer Leray Schauder and Coincidence Carefully develops manifolds and functions on manifolds ending with Riemannian metrics Suitable for advanced students in mathematics and associated disciplines Can be used as a traditional textbook as well as for self study Author James K Peterson is an Emeritus Professor at the School of Mathematical and Statistical Sciences Clemson University He tries hard to build interesting models of complex phenomena using a blend of mathematics computation and science To this end he has written four books on how to teach such things to biologists and cognitive scientists These books grew out of his Calculus for Biologists courses offered to the biology majors from 2007 to 2015 He has taught the analysis courses since he started teaching both at Clemson and at his previous post at Michigan Technological University In between he spent time as a senior engineer in various aerospace firms and even did a short stint in a software development company The problems he was exposed to were very hard and not amenable to solution using just one approach Using tools from many branches of mathematics from many types of computational languages and from first principles analysis of natural phenomena was absolutely essential to make progress In both mathematical and applied areas students often need to use advanced mathematics tools they have not learned properly So he has recently written a series of five books on mathematical analysis to help researchers with the problem of learning new things after they have earned their degrees and are practicing scientists Along the way he has also written papers in immunology cognitive science and neural network technology in addition to having grants from the NSF NASA and the US Army He also likes to paint build furniture and write stories
