Osiewacz, 2013-11-11 Mycology the study of fungi originated as a subdiscipline of botany and was a descriptive discipline largely neglected as an experimental science until the early years of this century A seminal paper by Blakeslee in 1904 provided evidence for self incompatibility termed heterothallism and stimulated interest in studies related to the control of sexual reproduction in fungi by mating type specificities Soon to follow was the demonstration that sexually reproducing fungi exhibit Mendelian inheritance and that it was possible to conduct formal genetic analysis with fungi The names Burgeff Kniep and Lindegren are all associated with

this early period of fungal genetics research These studies and the discovery of penicillin by Fleming who shared a Nobel Prize in 1945 provided further impetus for experimental research with fungi Thus began a period of interest in mutation induction and analysis of mutants for biochemical traits Such fundamental research conducted largely with *Neurospora crassa* led to the one gene one enzyme hypothesis and to a second Nobel Prize for fungal research awarded to Beadle and Tatum in 1958 Fundamental research in biochemical genetics was extended to other fungi especially to *Saccharomyces cerevisiae* and by the mid 1960s fungal systems were much favored for studies in eukaryotic molecular biology and were soon able to compete with bacterial systems in the molecular arena

Recycled Polymers Vijay Kumar Thakur, 2015-04-27 The increasing consumption of different kinds of polymer based materials results in huge amount of waste materials Once the polymers have fulfilled the function for which they have been manufactured they are disposed of in landfills in large amounts each year which is incompatible with current environmental goals The disposal of polymer based plastics such as incineration and

landfill results in environmental pollution and land occupation. These current levels of polymer disposal are not sustainable and polymer recycling, which is one of the most important actions currently available to reduce the negative impacts, receives increasing attention. Recycling provides opportunities to reduce oil usage, carbon dioxide emissions, and the quantities of polymer wastes, as well as the negative impacts of disposal. Using recycled polymer wastes to replace virgin materials in some applications, such as non-food packaging and automotive components, can effectively decrease the demand for the amount of imported oil and conserve raw materials. Further, it can also lead to energy saving and creating new jobs. Considering all the positive impacts of polymer recycling on environment, economy, and society, considerable attention is being given to recovering materials from polymer wastes. This book is ideal for all those who are interested in recycling of post-consumer polymer waste. It is the outcome of untiring efforts of the researchers with extensive experience in the field of recycled polymers. The book enables the reader to gain a thorough understanding of the chemistry and processing of recycled polymers and also provides an instrumental resource for those already working in this field. Some of the main features are:

- Highlights the chemistry of recycled polymers and compares with traditional polymers.
- Discusses the processing of different kinds of recycled polymers.
- Highlights new frontiers in the different processing techniques.
- Evaluates the performance of recycled polymers.
- Focus on recyclability and up-to-date progress on recycled polymers.
- Present state of polymer recycling.
