Demographic Methods across the Tree of Life Roberto Salguero-Gomez, Marlène

Gamelon, 2021-08-31 Demography is everywhere in our lives from birth to death Indeed the universal currencies of survival development reproduction and recruitment shape the performance of all species from microbes to humans The number of techniques for demographic data acquisition and analyses across the entire tree of life microbes fungi plants and animals has drastically increased in recent decades These developments have been partially facilitated by the advent of technologies such

as GIS and drones as well as analytical methods including Bayesian statistics and high throughput molecular analyses. However, despite the universality of demography and the significant research potential that could emerge from unifying i) questions across taxa, ii) data collection protocols and iii) analytical tools, demographic methods to date have remained taxonomically siloed and methodologically disintegrated. This is the first book to attempt a truly unified approach to demography and population ecology in order to address a wide range of questions in ecology, evolution and conservation biology across the entire spectrum of life. This novel book provides the reader with the fundamentals of data collection, model construction, analyses and interpretation across a wide repertoire of demographic techniques and protocols. It introduces the novice demographer to a broad range of demographic methods including abundance based models, life tables, matrix population models, integral projection models, integrated population models, individual based models and more. Through the careful integration of data collection methods, analytical approaches and applications, clearly guided throughout with fully reproducible R scripts, the book provides an up to date and authoritative overview of the most popular and effective demographic tools. *Demographic Methods across the Tree of Life* is aimed at graduate students and professional researchers in the fields of demography, ecology, animal behaviour, genetics, evolutionary biology, mathematical biology and wildlife management. **Mathematical Models in Population Biology and Epidemiology** Fred Brauer, Carlos

Castillo-Chavez, 2011-11-09 The goal of this book is to search for a balance between simple and analyzable models and unsolvable models which are capable of addressing important questions on population biology. Part I focusses on single species simple models including those which have been used to predict the growth of human and animal population in the past. Single population models are in some sense the building blocks of more realistic models, the subject of Part II. Their role is fundamental to the study of ecological and demographic processes including the role of population structure and spatial heterogeneity, the subject of Part III. This book, which will include both examples and exercises, is of use to practitioners, graduate students and scientists working in the field. *Primate Life Histories and Socioecology* Peter M. Kappeler, Michael

E. Pereira, 2003-02 Table of contents [Flukes and Snails Revisited](#) D. Rollinson, L. H. Chappell, 2001 Summarises the current state of various studies investigating snail-parasite relationships [Mathematics for Life Science and Medicine](#) Yasuhiro Takeuchi, Yoh Iwasa, Kazunori Sato, 2007-01-25 Dynamical systems theory in mathematical biology has attracted much attention from many scientific directions. The purpose of this volume is to present and discuss the many rich properties of the dynamical systems that appear in life science and medicine. The main topics include cancer treatment, dynamics of paroxysmal tachycardia, vector-borne diseases, model epidemic diseases and metapopulations, immune systems, pathogen competition and coexistence and the evolution of virulence and the rapid evolution of viruses within a host. Each chapter will serve to introduce students and scholars to the state of the art in an exciting area, to present new results and to inspire future contributions to mathematical modeling in life science and medicine. **Biological Science** Jon Scott, Anne

Goodenough, Gus Cameron, Dawn Hawkins, Martin Luck, Jenny Koenig, Alison Snape, Despo Papachristodoulou, Kay Yeoman, Mark Goodwin, 2022 A fresh approach to biology centred on a clear narrative active learning and confidence with quantitative concepts and scientific enquiry Spanning the breadth of biological science and designed for flexible learning it will give you a deeper understanding of the key concepts and an appreciation of biology as a dynamic experimental science

Eucalypt Ecology Jann Elizabeth Williams, John Woinarski, 1997-11-13 The dominant trees of Australia eucalypts make up a remarkable genus This authoritative volume provides current reviews by active researchers of many disciplines including evolutionary history genetics distribution and modelling the relationship of eucalypts to fire and nutrients ecophysiology pollination and reproductive ecology interactions between eucalypts and other co existing biota including fungi invertebrates and vertebrates and conservation and management Together these reviews shed light on the reasons for the great success of eucalypts in Australian environments and provide a comprehensive summary for comparison with the ecology of major woody plant genera in other continents This volume is of particular relevance to Australian ecologists but also provides a stimulating perspective to students of vegetation ecology in all continents The Population Structure of Vegetation J. White, 2013-11-09 The Handbook of Vegetation Science is growing After the first volumes under my editorship have appeared the interest of the scientific community has been revived and many new volume editors have started their work The present volume was jointly designed by Drs J White and W Beetsink Due to unforeseen developments Dr White signs now as the sole editor The development of this volume within the series had a special history as Dr White points out in his preface Adding to this I need only to state that I found it essential to include the topic of this volume into a Handbook of Vegetation Science It was included therefore in my first revised list of topics to be included in the Handbook when I took over from Dr T xen It is a great pleasure for me to see this volume appear Having read through the many contributions to this volume I can certainly congratulate Drs White and Beetsink for their success in generating so much interest in this volume among their colleagues The cooperation on this volume is the first sign that the new concept of the Handbook has been understood by the generation of scientists which I have to address The influence this volume will have on the field of plant population studies only time can tell It appears to me however that this volume will become a standard resource for some future Dr White asked me to have this volume dedicated to Dr Rabotnov

Wildlife 2001: Populations D.R.

McCullough, R.H. Barrett, 2012-12-06 In 1984 a conference called Wildlife 2000 Modeling habitat relationships of terrestrial vertebrates was held at Stanford Sierra Camp at Fallen Leaf Lake in the Sierra Nevada Mountains of California The conference was well received and the published volume Verner J M L Morrison and C J Ralph editors 1986 Wildlife 2000 modeling habitat relationships of terrestrial vertebrates University of Wisconsin Press Madison Wisconsin USA proved to be a landmark publication that received a book award by The Wildlife Society Wildlife 2001 populations was a followup conference with emphasis on the other major biological field of wildlife conservation and management populations It was

held on July 29 31 1991 at the Oakland Airport Hilton Hotel in Oakland California in accordance with our intent that this conference have a much stronger international representation than did Wildlife 2000 The goal of the conference was to bring together an international group of specialists to address the state of the art in wildlife population dynamics and set the agenda for future research and management on the threshold of the 21st century The mix of specialists included workers in theoretical as well as practical aspects of wildlife conservation and management Three general sessions covered methods modelling and conservation of threatened species

Migration : The Biology of Life on the Move Davis Hugh Dingle
Professor in the Department of Entomology and Center for Population Biology University of California, 1996-01-18 Migration is one of the most fascinating and dramatic of all animal behaviors Historically however the study of migration has been fragmented with ornithologists entomologists and marine biologists paying little attention to work outside their own fields This treatment of the subject shows how comparisons across taxa can in fact illuminate migratory life cycles and the relation of migration to other movements The book thus takes an integrated ecological perspective focusing on migration as a biological phenomenon The work is divided into four parts each with a brief introductory section Part I defines migration gives examples and places migration in the spectrum of movement behaviors concluding with a chapter on methods for its study Part II focuses on proximate mechanisms including physiology and morphology and the constraints associated with them the interactions between migration and wind and current patterns and the various orientation and navigation mechanisms by which migrants find their way about Part III on the evolution of migratory life histories addresses the evolutionary and ecological basis for migration and the roles of migration not only in the lives of organisms but also in the ecological communities in which they live Part IV is devoted to a brief consideration of migration and its relation to pest management and conservation As a major contribution to a vital subject this work will be valued by all researchers and students in the field of animal behavior ecology and zoology

Population Ecology in Practice Dennis L. Murray, Brett K. Sandercock, 2019-12-20 A synthesis of contemporary analytical and modeling approaches in population ecology The book provides an overview of the key analytical approaches that are currently used in demographic genetic and spatial analyses in population ecology The chapters present current problems introduce advances in analytical methods and models and demonstrate the applications of quantitative methods to ecological data The book covers new tools for designing robust field studies estimation of abundance and demographic rates matrix population models and analyses of population dynamics and current approaches for genetic and spatial analysis Each chapter is illustrated by empirical examples based on real datasets with a companion website that offers online exercises and examples of computer code in the R statistical software platform Fills a niche for a book that emphasizes applied aspects of population analysis Covers many of the current methods being used to analyse population dynamics and structure Illustrates the application of specific analytical methods through worked examples based on real datasets Offers readers the opportunity to work through examples or adapt the routines to their own

datasets using computer code in the R statistical platform Population Ecology in Practice is an excellent book for upper level undergraduate and graduate students taking courses in population ecology or ecological statistics as well as established researchers needing a desktop reference for contemporary methods used to develop robust population assessments
