

Figure 46: Detection zone for a human intrusion (left) and for a car (right)

Note: the maximum instrumented range of a PSR-500 system radar is 900m. Beyond the range, the system won't be able to detect. This explains why the detection zone for the car seems to be truncated beyond this range.

Note: the PSR-500 Installer assumes that there is no obstacle in the radar coverage between the target and the radar, and assumes that the radial velocity of the target is high enough to be detected by the radar.

The last concept to remind is the « Doppler effect » on which rely the PSR-500 radars.

While non-Doppler radars compare radar image after radar image to detect motion in the area, Doppler radars use the Doppler Effect to do so.

The Doppler Effect is an effect visible on the radar signal due to the change of range of the target within the observation time of the radar. The Doppler effect provides access to the **radial velocity of the targets**

The radial velocity of a target is the projection of its absolute velocity of this intrusion over the straight line from the radar to the intrusion. This projection depends on the direction and on the speed of the intruder movement:

Figure 47: Illustration radial velocity (3D/2D)

Note: the radial velocity **is independent from the sensor orientation**.
