Polymerase Chain Reaction

Synopsis

In this Polymerase Chain Reaction (PCR) simulation, you will see through eight steps another method, known as restriction fragment length polymorphism (RFLP), for identifying DNA using restriction enzymes and short known DNA fragments called probes. In the final step, you will learn that RFLP suggests a similarity, but not a relationship.

Design and

After sampling, you will go to the restriction enzyme step. The samples of DNA you collected, by using a restriction enzyme, are cut into fragments from the same source. It is up to you to make sure that restriction enzymes are used in the right positions.

Now the structure of DNA results appears on screen.

In the simulation, you learn that DNA supercoils at the restriction sites, illustrating the structure of DNA and the restriction sites. Restricting will be used throughout the experimental process, as well as all specifications of the restriction.

Identify the restriction

In the first simulation, you will collect your samples and other needed samples from the laboratory. You will also learn restriction site patterns and how to use the restriction site patterns.

Learning Objectives

In this part of the simulation, you will see the results:

1. Identify the location of the restriction sites and the restriction sites.
2. Identify the restriction sites using the results of the restriction sites.
