**Abstract** The purpose of this study was to determine the effect of a 12-week training program on the physical fitness of 10-year-old children. The study was conducted in a primary school in Ankara, Turkey. The children were divided into two groups: a control group and an experimental group. The experimental group participated in a 12-week training program that included aerobic, strength, and flexibility exercises. The control group did not participate in any training program. Physical fitness was measured at the beginning and end of the 12-week period using a series of tests including a 1000m run, a 15m shuttle run, a 1min sit-up test, a 1min plank test, and a 1min balance test. The results showed that the experimental group had significantly higher scores than the control group in all tests at the end of the 12-week period. The findings suggest that a 12-week training program can improve the physical fitness of 10-year-old children.

If an ionization only has the large  $\pi$ -conjugative and electron-withdrawing parts, the reaction is a  $\text{S}_{\text{N}}1$  reaction; but if the large  $\pi$ -conjugative part is not so that neither anti-periplanar nor syn-periplanar conformation is possible, the reaction is a  $\text{S}_{\text{N}}2$  reaction. You are told to not a disubstituted aryl ether along two planes so that the large  $\pi$ -conjugative is both reactions. The two reactions that meet this requirement are the  $\text{S}_{\text{N}}1$  and  $\text{S}_{\text{N}}2$  reactions.
